When these undulations reach and act on the nerves of our retina, they produce in us the sensation of light. The only other theory of light which can be opposed to this, and which is variously called the *corpuscular*, *emission*, or *material theory*, supposes light to consist of material particles, emitted from the source, and projected in straight lines in all directions with a velocity which continues uniform at all distances, and is the same for all intensities. It would seem that every phenomenon which can be brought under the corpuscular theory can with equal facility be explained by the undulatory theory; while there are some known effects, as the phenomena of reflection and refraction, in strict accordance with the principles of the latter, which cannot, without great difficulty and the introduction of gratuitous suppositions, be accounted for by the corpuscular theory. The undulatory theory is therefore now generally adopted by physicists.

the state of being united; junction; coalition; as, the *union* of soul and body. *Union* differs from *connection*, as it implies the bodies to be in contact, without an intervening body; whereas things may be *connected* by the intervention of a third body, as by a cord or chain.

It is in the discretion of the Local Government Board to consolidate any two or more parishes into one union under a single board of guardians elected by the owners and rate-payers of the component parishes. Union Flag of Britain.

The national flag of England was the banner of St. George (heraldically described as argent, a cross gules), and soon after the union of the crowns this was united with the Scottish national flag or banner of St. Andrew (in the language of heraldry azure, a saltire argent), thus forming the first union flag. On the legislative union with Scotland in 1707 a new design for the national or union flag was adopted, described in heraldic terms as azure, a saltire argent surmounted by a cross gules fimbriated or edged of the second. On the union with Ireland the red cross or saltire of St. Patrick was introduced, and as thus modified the flag now exists. The union flag, when used by itself or as an independent flag, is the national banner always used on shore. When it occupies the upper corner or canton next the staff of a red, white, or blue field, the flag so formed is called the red, white, or blue ensign, and in this form it is only used on board ship. (See JACK.) The union of the United States is a blue field with white stars, the stars denoting the union of the States and properly being equal in number to the states. The name seems also to be given to a corresponding portion of any flag.—6. The *U. margaritifera* is the pearl-mussel found in various British rivers, in the north of Europe, and in Canada. *U. pictorum* derives its name from its shell being used to hold paints. The Unionidae are distinguished from the Mytilidae (mussels proper) by having a larger foot, which does not produce a byssus except in the very young state. The sexes are distinct; and all the known members of the family are inhabitants of fresh water, being especially abundant in the rivers of North America.

S. system*, adopts the *centimetre* as the unit of length, the *gramme* as the unit of mass, and the *second* as the unit of time, these words being represented respectively by the above letters. In this system the *unit of area* is the square centimetre, the *unit of volume* is the cubic centimetre, and the *unit of velocity* is a velocity of a centimetre per second. The *unit of momentum* is the momentum of a *gramme* moving with a velocity of a centimetre per second. The *unit-force* is that force which acting on a *gramme* for one second generates a velocity of a centimetre per second. This force is called a *dync* (which see). The *unit of work* is the work done by the force of a *dync* working through a distance of a centimetre. 2. In *philos.* a general notion or idea; that which by its nature is fit to be predicated of many; that which by its nature has a fitness or capacity to be in many. Universals have been divided into *metaphysical*, or those archetypal forms existing in the divine mind and forming the patterns after which all things were created; *physical*, or certain common natures diffused over or shared in by many, as *rationality* by all men; and *logical*, or general notions framed by the human intellect, and predicated of many things, on the ground of their possessing common properties, as *animal*, which may be predicated of man, lion, horse, &c. In *anc. philos.* the universals were called *predicables*, and were arranged in five classes, *genus, species, differentia, proprium*, and *accidens*.

The same colour being observed to-day in chalk or snow which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind, and having given it the name of whiteness, it by that sound signifies the same quality wherever to be imagined or met with, and thus *universals*, whether ideas or terms, are made. *Locke*.

Universe (ū-ni-vēr-s), *n.* [Fr. *univers*, from *L. universum*, the universe, neut. of the adj. *universus*, all together, all taken collectively, the whole. See **UNIVERSAL**.] The general system of things; all created things viewed as constituting one system or whole; the whole creation; the world; the *pan* of the Greeks and the *mundus* of the Latins.

For nothing this wide universe I call,
Save thou, my rose; in it thou art my all. *Shak.*

— *World, Universe, Creation*. *World* properly signifies this globe and everything inhabiting it, as animals and vegetables, or immediately associated with it, as the atmosphere, &c. *Universe* designates the entire mass of worlds, with everything associated with them, comprehending all stars, planets, satellites, comets, &c., regarded as one system. *Creation*, in its most extended sense, is nearly synonymous with *universe*, differing from it principally in not comprehending the Great First Cause and the idea of space. It is often used in a sense limited by the epithet or qualifying word preceding it, as, *the brute creation*, *the rational creation*.

University (ū-ni-vēr-si-ti), *n.* [L. *universitas*, the whole of anything as contrasted with its parts, the universe; later, an association, corporation, company, &c.] 1. The whole; the universe. 'Speaking with respect to the *universality* of things.' *Barrow*. — 2. A corporation; a guild. — 3. In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important branches of science and literature, and having the power of conferring certain honorary dignities, termed *degrees*, in several faculties, as arts, medicine, law, and theology. In most cases the corporations constituting universities include a body of teachers or professors for giving instruction to students; but this is not essential to a university, the staff of London University being merely an examining body. In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either by faculty or by country (hence the 'nations' into which the students were classed), or both together, its meaning being determined by the words with which it was connected. At a later period the expression *universitas literaria* (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be taught in these establishments; and it would seem that the twofold application of *universitas* led to the distinctive meaning of the term as now used. Some, forming their notion of the word *university* merely from the English universities, suppose that it necessarily means a collection and union of colleges, that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear any resemblance to the English colleges. Besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Bologna and Paris, and these formed models on which many other universities that subsequently sprung up in various parts of Europe were established.

Uranium (û-rân'î-um), *n.* Sym. *U*. At. wt. 240; sp. gr. 18.4. A rare metal, whose oxide *Klaproth*, in 1789, discovered in pitchblende or pechblende and uranite. Peligot first isolated uranium in a pure form in 1840, and determined its atomic weight, at the same time showing that *Klaproth's* uranium was a protoxide (*U* O). It was not obtained compact till 1856. The chief source of uranium is pitchblende, which contains nearly 80 per cent of the black oxide and uranite. Metallic uranium is obtained by decomposing its protochloride with potassium or sodium, first in the form of a black powder, or sometimes aggregated on the aides of a crucible in small plates, having a silvery lustre and a certain degree of malleability. By subjecting the metal in either of these forms to further processes it is ultimately obtained in fused globules. In its compact state uranium is somewhat malleable and hard, but is scratched by steel. Its colour is like that of nickel or iron. When exposed to the air it soon tarnishes and assumes a yellow colour. Uranium forms several oxides, which are used in painting on porcelain, yielding a fine orange colour in the enamelling fire, and a black colour in that in which the porcelain itself is baked.

In *astron.* one of the primary

planets, discovered by Sir William Herschel in 1781. It was first called *Georgium Sidus* in honour of George III., afterwards called *Herschel*, in honour of the discoverer. It is the seventh planet in order of distance from the sun. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1754 millions of miles, and the length of the year 36686.32 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 12½ times more. The length of its day is supposed to be between 9 and 10 hours. There is still some uncertainty as to the number of satellites belonging to *Uranus*. *Herschel* records six, and two of the four which are seen by astronomers at the present time cannot be identified with any of these. The satellites of *Uranus* differ from the other planets, primary and secondary (with the exception of *Neptune's* satellite), in the direction of their motion, which is from east to west, and they move in planes nearly perpendicular to the ecliptic.

It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid excretions of birds and serpents is principally composed of uric acid and urate of ammonia; and guano, which is the decomposed excrement of aquatic birds, is mainly impure uric acid in a remarkable state of decomposition. Uric acid constitutes the principal proportion of the urinary calculi and the concretions causing the complaint known as the gravel. It crystallizes in fine scales of a brilliant white colour and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. When it is dissolved in nitric acid, and the solution is evaporated and treated with ammonia, a fine purple colour is produced; by this reaction uric acid may be detected.

The inquiry what these *Urim* and *Thummim* themselves were seems likely to wait as long for a final and satisfying answer.

In its natural state it is acid, transparent, of a pale amber or straw colour, a brackish taste, a peculiar odour, and of a specific gravity varying from 1 012 to 1 030. The character of the urine, however, is apt to be altered by a variety of circumstances, and from the variety of the substances extracted from the body through the medium of the kidneys the urinary system may be regarded as the emunctory of the entire animal economy, in which we meet with every principle and constituent that analysis has discovered forming the solids and fluids of the body. A knowledge of the urine in health, and of the variations to which it is subject in disease, is of the utmost importance to the medical practitioner, as the different appearances of this fluid indicate not merely the state of the urinary system, but the changes which have taken place in other parts of the animal economy. It varies even in its healthy state according to age, drink, food, medicines, the time of the year, the muscular motion of the body, and the affections of the mind.

It was in the winter of 1822-23 that I formed the plan of a little society, to be composed of young men engaged in fundamental principles—acknowledging *Utility* as their standard in ethics and politics, and a certain number of the principal corollaries drawn from it in the philosophy (Benthamism) I had accepted—and meeting once a fortnight to read essays and discuss questions conformably to the premises thus agreed on. The fact would be worth mentioning, but for the circumstance that the name I gave to the society I had planned was the *Utilitarian Society*. It was the first time that any one had taken the title of *utilitarian*; and the term made its way into the language from this humble source. I did not invent the word, but found it in one of Galt's Novels, *The Annals of the Parish*, in which the Scotch clergyman, of whom the book is a supposed autobiography, is represented as warning his parishioners not to leave the gospel and become *utilitarians*. With a boy's fondness for a name and a banner I seized on the word, and for some years called myself and others by it as a sectarian appellation; and it came to be occasionally used by some others holding the opinions which it was intended to designate. *J. S. Mill.*

S. Mill.*

V.

V, the twenty-second letter of the English alphabet, representing a labial or labiodental consonant sound, produced by the junction of the upper teeth with the lower lip, as in pronouncing *av*, *ev*, or *vain*. Its sound (which never varies) is accompanied by the same position of the organs as that required for *f*, but *v* is uttered with voice, and is therefore called sonant, while *f* is surd, or uttered with breath merely. Both *v* and *f* are also continuous consonants, their sound being not checked at once (as in the case of *p*, *t*, &c.), and they also belong to the class of the spirants. As mentioned under *U*, *v* and *u* were formerly the same letter, but they have now as distinct uses as any two letters in the alphabet. The Roman letter *v* consonant was probably pronounced as a *v*: thus *ver*, spring, would be pronounced *ver*; *vespa*, a wasp, *vespa*. This letter did not belong to the Anglo-Saxon alphabet, and its sound is believed to have been represented by *f*, but appears to have occurred only between two vowels (as in *heaven*, heaven). At the beginning of words *f* regularly kept its own sound, and this explains how at the present day scarcely any of the English words that begin with *v* are Teutonic (*eat*, *vane*, and *vizen* are exceptions), though *v* is common enough in the body of words, as in *have*, *leave*, *live*, *heaven*, &c. Almost all English words with initial *v*, therefore, are of Romance origin, the letter having entered our alphabet from the French. The giving of the *v* sound to *f* also illustrates the change of consonant in the plural of such words as *thief*, *thieves*, *wolf*, *wolves*, *life*, *lives*. In the dialect of Southern England *v* commonly takes the place of *f*. In spelling this letter is never final (though its sound often is), nor is it ever doubled. See also *U*.—As a numeral, *V* stands for 5.—In *music*, *V*, *S*, stands for *volta subito*, turn over (the leaf) quickly.—In *her. V* is used to express *vert* or *green*, in the tricking or drawing of arms with a pen and ink.

Vaccination (vak-si-nā'shon), *n*. The act of vaccinating; the art or practice of inoculating persons with the cow-pox, either directly or indirectly, for the purpose of securing them from the contagion of small-pox. The indirect method of vaccination by lymph taken from a pustule caused by previous vaccination in a healthy child is the most common. Dr. Jenner was the first who showed the beneficial effects of vaccination, which, in a great proportion of instances, confers a complete security against small-pox. Even in those cases where the small-pox does occur after vaccination it is generally divested of its more formidable characters. Repeated vaccinations, with intervals of several years, are believed to increase the security. In

England the vaccination of all children, excepting those in an unhealthy or otherwise unfit condition, is compulsory within three months after birth; in Scotland the time extends to six months. See **COW-POX**, also **INOCULATION**.

The species are natives of North America, where they are abundant; in Europe they occur sparingly, but they are not uncommon in mountainous districts. The properties of the order closely resemble those of Ericaceæ, with which, indeed, Vacciniaceæ have much in common, being mainly distinguished by the inferior ovary and epigynous stamens. The bark and leaves of many of the species are astringent, slightly tonic, and stimulating. The berries of many are eaten under the names of cranberry, whortleberry, &c. Several species are elegant garden shrubs, as those belonging to the genus *Gaylussacia*. The typical genus is *Vaccinium*.

Vacuum (vak'û-um), *n. pl. Vacuums (vak'û-umz), or sometimes **Vacua** (vak'û-a). [L., an empty space, a void or vacuity, neut. sing. of *vacuus*, empty; akin *vacant*, *vacation*, &c.] Space empty, or space devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epi-*

cureans, and Atomists; but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' The modern theory, which seems to be warranted by experience, is that an absolute vacuum cannot exist, the subtle medium known as ether being believed to be everywhere present. In a less strict sense a vacuum (more or less perfect) is said to be produced when air is more or less completely removed from an inclosed space, such as the receiver of an air-pump, a portion of a barometric tube, &c. In the receiver of the air-pump the vacuum can only be partial, as the exhaustion is limited by the remaining air not having sufficient elasticity to raise the valves. The Torricellian vacuum, that is, the space above the mercury in a carefully manipulated barometer tube, is more nearly perfect in this respect, but the space is to some extent filled with the vapour of mercury. If, however, an air-pump receiver, filled with pure carbonic acid gas (so as to expel the air), be exhausted, a small vessel containing moist caustic potash, and another containing concentrated sulphuric acid, having been previously introduced, the remaining carbonic acid is taken up and a vacuum produced so nearly absolute that the electric spark fails to pass through it.

H. Knight.*

Vacuum-pan (vak'û-um-pān), *n.* A vessel for boiling saccharine juices in a partial vacuum during the process of sugar-making. It is usually spheroidal in shape, and is made in two segmental or semi-globular portions. The vapour from the boiling juice rises into the dome at the top, when it is removed by a pump or condenser. The advantages of this vessel over the old pans are that the quality and quantity of the crystallizable sugar are raised, a smaller proportion of grape-sugar or molasses being produced. *E. H. Knight.*

Some valves are self-acting, that is, they are so contrived as to open in the required direction by the pressure of the fluid upon their surface, and immediately to shut and prevent the return of the fluid when the direction of its pressure changes. Others are actuated by independent external agency. Examples of the former kind are presented in the valves of pumps, and in the safety-valves of steam boilers, and of the latter in the slide-valves appended to the cylinder of a steam-engine for the purpose of regulating the admission and escape of the steam. The construction of valves admits of an almost endless variety, and the names given to the different classes are derived from peculiar shape, application, mode of actuation, function, &c. They have all a small blind membrane on the nose, no tail, and the inter-femoral membrane little de-

veloped. Their peculiar characteristics, however, are two large projecting upper incisors and two lancet-shaped superior

metal discovered by Sefström in 1830 in iron prepared from the iron ore of Taberg in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead in Scotland, and in a similar mineral from Zimapan in Mexico, and in the sandstone of Alderley Edge, and Mottram St. Andrew, Cheshire. The metal was first obtained by Roscoe, who showed that the substance generally regarded as vanadium was really an oxide. Vanadium has a strong metallic lustre, considerably resembling silver, but still more like molybdenum. When in mass it is not oxidized either by air or water, but the finely powdered metal quickly takes up oxygen from the air. Oxygen and vanadium combine to form five oxides—viz. a monoxide (V_2O), a dioxide (V_2O_2), a trioxide (V_2O_3), a tetroxide (V_2O_4), and a pentoxide (V_2O_5).

1. In *physics*, a term applied to designate the gaseous form which a solid or liquid substance assumes when heated. *Vapour* is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a *vapour*, such as steam. In common language, however, a difference is usually recognized: a *gas* is a substance which at ordinary temperatures and pressures exists in a state of *vapour*; while a *vapour* is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of *vapour*, while superheated steam is said to be a *gas*. Aqueous *vapour* formed on the surface of the land and water

is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See EVAPORATION. 2. 2. The extent to which a thing varies; the degree, interval, or amount of departure from a former condition or position; amount or rate of change.—3. In *gram.* change of termination of words, as in declension, conjugation, comparison, and the like; inflection. Watts.—4. The act of deviating; deviation; as, a *variation* of a transcript from the original.—5. In *astron.* any deviation from the mean orbit or mean motion of a heavenly body, occasioned by another disturbing body. When these deviations are compensated in comparatively short periods of time they are called *periodic variations*, but when the compensation requires an immense period of time for its consummation the variation is called a *secular variation*.—*Variation of the moon*, an inequality in the moon's rate of

motion, occasioned by the attraction of the sun, and depending as to its degree on the moon's position in her orbit.—6. In *physics* and *navigation*, the deviation of the magnetic needle, or needle of the mariner's compass, from the true north point; or the angle which the needle makes with the plane of the meridian of a ship or station; called also *Declination*. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1576, in London, the variation was 11° 15' east; in 1652, the needle pointed due north, after which time it travelled about 24° to the westward (the maximum being in 1815); it is now considerably less and is continually decreasing. The variation, however, is very different in different parts of the globe, and it is also subject to diurnal changes in the same place.—7. In *music*, one of a series of ornamental changes or embellishments in the treatment of a tune, movement, or theme during several successive repetitions. The simplest kind of variation is by introducing into the melody a greater or less number of passing notes (that is, notes intermediate in pitch between the original notes of the air), together with cadenzas, scale movements, and the like, or by breaking of the chords into triplets, quadruplets, &c., or throwing them into arpeggio form, the fundamental harmony usually remaining unchanged. In more elaborate styles, however, new harmonies, rhythms, and melodic developments gradually appear, often brilliantly displaying the fertility of the composer's fancy. In many cases variations are mere unmeaning ornaments designed to exhibit the mechanical dexterity of the performer.—*Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetric.—SYN. Change, modification, vicissitude, mutation, deviation.

Specifically, in scientific classifications, a subdivision of a species of animals or plants; an individual or group of individuals differing from the rest of the species to which it belongs in some accidental circumstances which are not essential to the species. Varieties are considered as less permanent than species, and those naturalists who look upon species as strictly distinct in their origin, consider varieties as modifications of them arising from particular causes, as climate, nourishment, cultivation, and the like. See the following quotation.

No one definition (of species) has satisfied all naturalists; yet every naturalist knows vaguely what he means when he speaks of a species. . . . The term *variety* is almost equally difficult to define; but here community of descent is almost universally implied, though it can rarely be proved. . . . Practically when a naturalist can unite by means of intermediate links any two forms, he treats the one as a *variety* of the other, ranking the most common, but sometimes the one first described, as the species, and the other as the *variety*. But cases of great difficulty. . . . Sometimes arise in deciding whether or not to rank one form as a *variety* of another even when they are closely connected by intermediate links. . . . Few well-marked and well-known *varieties* can be named which have not been ranked as species by at least some competent judges. *Darwin*.

In like manner the term *variety* is applied to inorganic substances of the same kind, which are susceptible of classification, to note differences in colour, structure, crystallization, and the like, all the varieties being referable to some one species which is assumed as the typically perfect standard; as, *varieties* of quartz, diamond, and the like.

in character. The Egyptians, Greeks, and Romans made them from precious and other stones, bronze, silver, gold, ivory, and glass, and often used them for sacrificial or other sacred purposes; but the most prevalent material for vases of all kinds, including those intended to hold the ashes of the dead, has generally been baked clay. Many of them exhibit great beauty and

elegance, and are ornamented by artistic designs of the most varied character; accordingly they have been much prized by antiquaries for the light they cast upon the history, mythology, religious, civil, and domestic customs of antiquity. The general name for the body of ancient Sanskrit hymns, with accompanying comments, believed by the Hindus to have been revealed by Brahma, and on which the Brahmanical system is based. The hymns, which are upwards of 1000, fall into four divisions (*Vedas* or *Sanhitas*), called respectively *Rig-Veda*, *Yajur-Veda*, *Sama-Veda*, and *Atharva-Veda*, of which the first (see *RIG-VEDA*) is the oldest and the *Atharva-Veda* the latest.

Each of these Vedas or *Sanhitas* consists of two parts—the *Sanhita* proper, or a collection of *Mantras* or hymns, consisting of invocations, adoration, thanksgiving, praise, prayer, and the like, and of *Brahmanas*, or commentaries, which have grown round the *Sanhita*, consisting of explanations, mystical and philosophical speculations, legends and illustrations, injunctions in regard to rites and sacrifices, and the like. Varying greatly in age, the Vedas represent many stages of thought and worship, the earliest being the simplest, and the later following and reflecting the development of the Brahmanical system with all its superstitions and rites. Even the most ancient Vedas exhibit a people in an advanced state of civilization. The Vedas had their origin in the wonder with which early man regarded the universe and the operations going on in it. They consist, therefore, largely of highly figurative addresses to the great powers of nature under seemingly individual names, as *Indra* (the Firmament), *Agni* (Fire), *Mitra* (Sunrise), *Varuna* (the Sea), and the like, behind whom, however, a great Being (*Om*) is dimly recognized. Gradually these powers became more and more endowed with personality, and ultimately came to be regarded as real divinities, to whose number more and more were gradually added.

The chief of the association (the *Freigraf*=free count) was usually a man of exalted rank, and had the supreme direction of the courts. His associates (*Freischoffen*=free justices) concurred in and executed the sentences of the court, being bound by a tremendous oath to obey all its behests, and keep secret its proceedings from all that is between heaven and earth. The assemblies of the tribunal were sometimes held in public and in the open air, but were generally held by night in a forest or in some other concealed place. Any person supposed to be guilty of heresy, sorcery, rape, theft, robbery, or murder, might be summoned before the court and compelled to answer the charge brought against him by the accuser, who was one of the *Freischoffen*. If the accused was found guilty of a capital crime, or if he repeatedly refused to appear on being duly cited, it was the duty of the *Freischoffen* to put him to death. This system offered great scope for the spirit of private revenge, malice, and interested motives, and many judicial murders were perpetrated. When the governments of the various states became more effective and society more settled, the regular executive struggled to destroy the power of the *vehmgerichte*, and ultimately succeeded, the last tribunal being held at Zell in 1568.

Vein (vân), *n.* [Fr. *veine*, from *L. vena*, a blood-vessel, vein, also natural bent, genius, supposed to be from same root as *veho*, to carry. See *VEIL*.] 1. One of a system of membranous canals or tubes distributed throughout the bodies of animals for the purpose of returning the impure blood from the extremities, surfaces, and viscera to the heart and lungs. They are devoid of elasticity, and have no pulsation, the motion of the blood being mainly secured by pressure of the moving muscles, between which they are imbedded, the backward flow of the blood being prevented where necessary by a series of valves which permit a current only towards the heart. The veins arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries. These venous capillaries unite to form ultimate veins, which still unite in turn, forming gradually larger branches and trunks as they approach the centre of the circulation. The venous blood returned from above the region of the heart is united in one great vein, the vena cava superior, all those from below entering by the vena cava inferior. The portal vein (vena porta) receives the venous blood from the intestines and conveys it through the liver to the vena cava inferior. The pulmonary vein and branches go from the right side of the heart to the lungs, carrying the blood to the air-sacs to be reinvigorated by the oxygen of the inspired air. The veins like the arteries are composed of three coats. Valves are absent in the vena porta, the portal, the pulmonary, and various other veins, and are present in greatest numbers in the veins of the extremities.—2. A tube or an assemblage of tubes through which the sap of plants is transmitted along the leaves. The term is more appropriately applied to the finer and more complex ramifications which interbranch with each other like net-work, the larger and more direct assemblages of vessels being called *ribs* and *nerves*. Veins are also found in the calyx and corolla of flowers.—3. A crack or fissure in a rock, filled up by substances different from the rock, and which may either be metallic or non-metallic. Veins are sometimes many yards wide, having a length of many miles, and they ramify or branch out into innumerable smaller parts, often as slender as threads. Metallic veins are chiefly found in the primary, and lower and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in veins.—4. A streak or wave of different colour, appearing in wood, in marble, and other stones; a long irregular streak of colour.—5. A cavity, fissure, or cleft, as in the earth or other substance. One of the older forms of this carriage consisted of two wheels of nearly equal size, placed one before the other, and connected by a beam on which the driver's seat was fixed. The rider, sitting astride the machine, propelled it by the thrust of each foot on the ground. This form dates from the early part of the present century. About half a century later treadles operating cranks on the axle of the front wheel came into use, and soon many modified and improved kinds became popular under the name of the bicycle. (See *BICYCLE*.) A three-wheeled velocipede, or tricycle, came also into use, as well as so-called tandems and various other forms, the term *cycle* being now commonly applied to all such vehicles. It is not applied to the movements of animals, or but rarely. See *CELERITY*.—2. In *physics*, rate of motion, whether fast or slow; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The velocity of a body is *uniform* when it passes

through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The velocity of a body is *accelerated* when it passes through a greater space in equal successive portions of time, as is the case of falling bodies under the action of gravity, and it is *retarded* when a less space is passed through in each successive portion of time. When the motion of a body is uniform its velocity is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform its velocity is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure velocity, may be assumed of any magnitude, but in theoretical mechanics one second is usually taken as the unit of time, and one foot as the unit of space.—*Angular velocity.* See under *ANGULAR*.—*Initial velocity*, the rate of movement of a body at starting; especially used of the velocity of a projectile as it issues from a firearm.—*Virtual velocity.* See under *VIRTUAL*.—*SYN.* Swiftness, rapidity, celerity, speed, fleetness, quickness.

—*Venal, Mercenary, Hireling.* Although both *venal* and *mercenary* are used in a bad sense, *venal* is much stronger than *mercenary*, standing to it in the relation of sale to hire. A *venal* man sells himself wholly to his purchaser, sacrificing character, honour, principle, his whole individuality in view for gain; a *mercenary* man acts with a view to profit in what he does, and is actuated by sordid motives, but he does not necessarily surrender himself unreservedly, or even make any sacrifice of principle. With the mercenary man love of gain is the chief motive; with the *venal* man it is in effect the only motive. *Hireling* denotes that hire is the motive, and thus implies something servile as well as mercenary, conveying more of contempt than of repro-
hation.

A very full inspiration is taken, which is breathed out slowly and gradually, the sound of the voice being dexterously modified and diminished by the muscles of the larynx and the palate. In England the county in which the trial of a particular cause takes place is said to be the venue of that cause. Originally jurors were summoned from the immediate neighbourhood where a fact happened to try it by their own knowledge, but they are now summonable from the body of the county. A venue is either *transitory* or *local*. It is *transitory* when the cause of action is of a sort that might have happened anywhere, and *local* when it could have happened in one county only. (See *Local Action*, *Transitory Action*, under *LOCAL*, *TRANSITORY*.) By the Judicature Act, 1875, the venue in all cases, civil and criminal, may be regulated by order in council. —To lay a venue, to allege a place.

In myth. the goddess of beauty and love, and more especially of sensual love. Venus was originally the Roman goddess of the spring, but at a comparatively late period she became identified with the Greek *Aphrodite*. She is represented as the highest ideal of female beauty and love, and was naturally a favourite

subject with the ancient poets and artists, some of her statues being among the noblest remains of Greek and Roman sculpture. Among the most famous of her statues are the Venus of

Cnidus, by Praxiteles, of which the Venus de Medici, found in the Villa Hadriana at Tivoli, is supposed to be a free copy, and the Venus of Milo or Melos, found in the island of Melos. Among the modern statues one of the most famous is the Venus of Canova, where she is represented as issuing from the bath. —2. In astron. one of the inferior planets, having its orbit between Mercury and the earth, and the most brilliant of all the planetary bodies. From her alternate appearance in the morning and evening she was called by the ancients *Lucifer* and *Hesperus*, the morning and evening star. The mean distance of Venus from the sun is about 66,134,000 miles; her diameter 7510 miles; and her period of revolution round the sun about 224.7 mean solar days. Her volume is equal to about $\frac{1}{11}$ ths of the earth, but her density being slightly greater her mass is actually equal to about $\frac{1}{11}$ ths of the earth. She revolves about an axis, and the time of rotation is about 23h. 21m, the axis of rotation being inclined to the ecliptic at an angle of about 75°. Her greatest angular distance from the sun is from 45° to 47° 12'. According to her various positions relatively to the sun and earth she changes her phases like the moon, appearing full at the superior conjunction, gibbous between that point and the points of her greatest elongation, half-mooned at these points, and crescent-shaped or horned between these and the inferior conjunction. Like Mercury, Venus transits the face of the sun, but at longer intervals. The transits of Venus are of much more importance than those of Mercury, because being nearer to us when in transit her position on the sun is measurably different for observers placed on different parts of the earth. See TRANSIT. —3. In old chem. a name given to copper. —4. In her. the green tincture in coat armour when borne by princes; vert. —5. A Linnaean genus of lamellibranchiate mollusca, family Veneridae. It is sometimes called *Ceracidlic* or *Sabadillie Acid*.

Verb (vĕrb), *n.* [Fr. *verbe*, from L. *verbum*, a word, a verb; from same root as *E. word* (which see).] 1. A word.

2. In *gram.* that part of speech whose essential function is to predicate or assert something in regard to something else (the subject or thing spoken of); as, the boy *runs*, the man *lifts* the stone, fishes *swim*, he *suffers* much. Verbs have the power of indicating time and mode by means of tenses and moods, but this is not an essential property. They have been divided into *active* and *neuter verbs*, according as they predicate action or state. Active verbs are divided into *intransitive* and *transitive*, according as the action is confined to the actor or passes from him to an object. Intransitive verbs often take an objective of their own nature; as, he *runs* a race; he *sleeps* the sleep of death. When a verb may be used either transitively or intransitively, as, he *walks* the horse, he *walks* to church, the verb in the former use is said to be *causative*. Many causative verbs are distinguished from their corresponding intransitives by a change of form, as *sit, set; lie, lay; fall, fell*. Some verbs are sometimes transitive, sometimes intransitive, and sometimes neuter; as, he *floats* a scheme; John can *float* now; the corpse *floats*. A small class of verbs, as *is, become, exist, wax, and grow* (in such phrases as, my hair *becomes* white; he *waxes* weak; he *grows* old), predicating only existence or transition from one state to another, are called *substantive verbs*, and this name is sometimes restricted to the verb *to be*. *Passive verbs* affirm suffering or endurance of what another does. Hence, only verbs which take an object after them can have a passive voice, because it can be said of objects only that they suffer or endure the action directed on or towards them by the subject of the active verb. Passive verbs are thus the correlatives or complements of active verbs. The infinitive mood, gerund, and supine are properly verbal nouns, implying action or state only without the power of assertion. Participle are adjectives plus the notion of time, and cannot therefore assert.

Vernier (vér-ni-ér), *n.* [From the inventor, *Pierre Vernier*, of Brussels, who died 1637.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and it is divided into a number of equal parts either greater by 1 or less by 1 than the number that it covers on the primary scale. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale *a b* is divided into inches and tenths of inches; the small movable scale *c d* is the *vernier*, and consists of a length of eleven parts of *a b*, divided into ten parts, each part being therefore equal

to one and one-tenth of the divisions upon *a*, *b*, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 28 inches 9 tenths on the scale. Hence, the vernier-division 1 is one-hundredth of an inch below the scale division 29 inches 9 tenths; division 2 on the vernier is two-hundredths below 29 inches 8 tenths, and so on. Supposing the vernier were raised any number of hundredths, as two hundredths of an inch, the division 2 would coincide with 29 inches 8 tenths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale must be taken for the hundredth required. The vernier now usually employed has one graduation more than the corresponding portion of the scale. The principle in both cases is, however, the same.

Vernier.

The term *vibration* is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse, by which means waves or undulations are caused. Villénage, **Villainage** (vil'en-aj), *n.* [See **VILLAIN**.] A tenure of lands and tenements by base services. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services.

Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villénage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villénage*, and sometimes *villénage socage*. It frequently happened that lands held in villénage descended in uninterrupted succession from father to son, until at length the occupiers or villeins became entitled, by prescription or custom, to hold their lands against the lord so long as they performed the required services. And although the villeins themselves acquired freedom, or their land came into the possession of freemen, the villein services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to show for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copy-hold*.

The disease manifests itself by the development of the fungus over the leaves or shoots as well as over the berries themselves, covering the affected parts with a white powdery-looking net-work of beaded flies. Growth is soon arrested, and decay or drying up, accompanied with an offensive smell, follows. (b) A disease due to the invasion of the parasitic insect *Phylloxera vastatrix*, which, making its first appearance near Avignon in France in 1865, spread over in less than ten years a great part of the richest vine-growing regions of that country, almost entirely destroying the crops in several districts. When the *Phylloxera* attacks a vine the rootlets exhibit peculiar swellings, and the insects multiply so rapidly as soon to overrun all the roots, and by absorbing nourishment from the plant reduce it to a totally exhausted state. No certain remedy has as yet been discovered against this evil. Many other fungous and insect parasites attack the vine, but with far less destructive effects.

Vinegar (vin'é-jér), *n.* [Fr. *vinaigre*, from *vin*, *L. vinum*, wine, and *aigre*, sour, *L. acer*, sharp, sour.] 1. Dilute and impure acetic acid, obtained by the vinous fermentation. In wine countries it is obtained from the acetous fermentation of inferior wines, but in this country it is usually procured from an infusion of malt which has previously undergone the vinous fermentation. Vinegar may also be obtained from strong beer, by the fermentation of various fruits, or of a solution of sugar mixed with yeast; in short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 3 of brown sugar, 1 of tartar, and $\frac{1}{2}$ of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*.—*Radical vinegar*, a more concentrated solution of acetic acid, obtained by distilling 3 parts of dry powdered acetate of soda with 9.7 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops.—*Wood vinegar*, an impure acetic acid obtained by the distillation of wood; called also *Pyroligneous Acid*. See FIDDLE.] An ancient musical instrument of much the same form as the violin, but having the belly and back flat, and with larger bends in the sides than that instrument. It may be considered as the parent of our modern instruments of the violin kind. The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and bass, each having from three to six strings, which were tuned in fourths and thirds.

Viol da gamba.—From Harleian MS.

The treble viol was somewhat larger than our violin, and the music for it was written in the treble clef. The tenor viol was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the *meau* or C clef. The dimensions of the bass viol were much the same as those of the violoncello, and the music for it was written in the bass clef. The smaller viols were called *viol da braccio*, from being held by the arm; the larger, *viol da gamba*, from being placed between the legs. The viol da gamba held its place longer than the smaller viols, but at last gave way to the violoncello.—*l'iol d'amore*, an obsolete instrument of the violin family. In addition to five or seven catgut strings,

the same number of metal strings, tuned in unison, were placed under the finger-board, which, by the production of sympathetic sound, gave a peculiar quality of tone to the instrument.—*Viola pomposa*, a species of *viol da gamba*, invented by Bach, having five strings, the four lower of which were tuned like the violoncello in fifths, and the fifth string was tuned to E.

Viola (vi'ö-la), *n.* [It.] A large kind of violin, to which the part between the second violin and the bass is generally assigned. See **VIOL**.] A well-known stringed musical instrument, consisting of four catgut strings, the lowest of which is covered with silvered copper wire, stretched by means of a bridge over a hollow wooden body, and played with a bow; a fiddle. It is considered the most perfect of musical instruments, on account of its capabilities of fine tone and expression, and of producing all the tones in any scale in perfect tune. It forms with its cognates, the viola, violoncello, and double-bass, the main element of all orchestras. The principal parts of the violin are the *scroll* or *head*, in which are placed the pins for tuning the strings; the *neck*, which connects the scroll with the body, and to which is attached the *finger-board*, upon which the strings are stopped by the fingers of the left hand as it holds the neck in playing; the *belly*, over which the strings are stretched, and which has two f-shaped sound holes, one on each side; the *back* or *under side*; the *sides* or *ribs*, uniting the back and belly; the *tail-piece*, to which the strings are fastened; and the *bridge*. The four strings of the violin are tuned at intervals of fifths, G, on the upper space of the bass staff, D, A, E reckoning upwards. Every intermediate semitone in its ordinary compass of 3½ octaves may be produced by stopping the strings, and the compass may be almost indefinitely extended upwards by the harmonics produced by touching the strings lightly. The violin can, to a limited extent, be made to produce harmony by sounding two or three strings together. Instruments of the violin kind are of great antiquity.

The principle of *virtual velocities* may be thus enunciated: 'If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an infinitely small space, which space will represent the *virtual* velocity of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction.' This great prin-

ple is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle the power multiplied by the space through which it moves in the vertical direction must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

In the early Vedas he appears as the manifestation of the sun, and was not regarded as the most exalted deity, this rank being accorded to him by the later writers of the Rāmāyana, the Mahābhārata, and more especially of the Purānas. The Brahmanic myths relating to Vishnu are characterized by the idea that, whenever a great physical or moral disorder affected the world, Vishnu descended in a small portion of his essence to set it right. Such descents are called *avatāras* or *avatars*, and consist in Vishnu's assuming the

form of some wonderful animal or superhuman being, or as being born in human form of human parents, and always endowed with miraculous power. These avatars are generally given as ten, nine of which are already past, the tenth, the *Kalki-avatāra*, being yet to come, 'when the practices taught by the Vedas and the institutes of the law shall have ceased, and the close of the *Kali* or present age shall be nigh.'

Vishnu is sometimes represented as riding on Garuda, a being half bird and half man; as holding in one of his four hands a conch-shell blown in battle, in another a disc, an emblem of supreme power; in the third a mace as the emblem of punishment; and in the fourth a lotus as a type of creative power.

The species, which are found chiefly in Asia and America, are climbing shrubs, with simple lobed, cut, or toothed, rarely compound leaves, and thyrsoid racemes of small greenish yellow flowers, and bearing in clusters a fruit called grapes. The best known, and by far the most important species, is the *V. vinifera*, the common vine or grape-vine, a native of Central Asia, of which there is a multitude of varieties. The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the eleventh and twelfth centuries considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in this country; but the grapes raised in hothouses are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. The vine is a long-lived plant; indeed, in warm climates, the period of its existence is not known. It is propagated from seeds, layers, cuttings, grafting, and by inoculation. Several species of vine are indigenous in North America, as the *Vitis Labrusca*, the wild-vine or fox-grape; *V. cordifolia*, heart-leaved vine or chicken-grape; *V. riparia*, river-side or sweet-scented vine. See WINE.

creatures, whether men or animals; especially, human utterance in speaking, singing, or otherwise; the sound made when a person speaks or sings; mode or character of sounds uttered; as, to hear a *voice*; to recognize a person's *voice*; a loud *voice*; a low tone of *voice*; 'a man's *voice*'; 'did utter forth a *voice*'; 'the *voice* of a nightingale.' *Shak.*

Like linnets in the pauses of the wind. *Tennyson.*

Voice as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of men and other animals; contradistinguished from *speech* or *articulate language*. *Voice* is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal chords (see under *VOCAL*), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. *Voice* can, therefore, only be found in animals in which the system of respiration is developed, and the lungs and larynx actually exist. Fishes having no lungs are dumb. In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the notes of the voice have nearly all the same pitch, and the variety of the sounds is due rather to articulation in the mouth than to definite movements of the glottis and vocal chords. In singing the successive sounds have vibrations corresponding in relative proportions to the notes of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and contralto. The lowest female note is an octave or so higher than the lowest note of the male voice; and the female's highest note is about an octave above that of the male. The compass of both voices taken together is about four octaves, the chief differences residing in the pitch and also in the timbre. 2. The faculty of speaking; as, to lose one's *voice*.—3. A sound produced by an inanimate object and regarded as representing the voice of an intelligent being; sound emitted; as, the *voice* of the winds. 'The trumpet's *voice*.' *Addison.*

9. In *phonetics*, sound uttered with resonance of the vocal chords, and not with a mere emission of breath; sonant utterance.

All consonants are really checks, and their character consists in their producing for a time a complete cessation of audible breath or *voice*. But *b* differs from *p* in so far as, in order to pronounce it, the breath must have been changed by the glottis into *voice*. *Max Müller.*

10. In *gram.* that form of the verb or body of inflections which shows the relation of the subject of the affirmation or predication to the action expressed by the verb. In Eng-

2. Having the quality of passing off by spontaneous evaporation; evaporating rapidly; diffusing more or less freely in the atmosphere. Substances which affect the smell with pungent or fragrant odours, as musk, hartshorn, and essential oils, are called *volatile* substances because they waste away on exposure to the atmosphere. Alcohol and ether are called *volatile* liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. On the contrary gold is a *fixed* substance because it does not suffer waste, even when exposed to the heat of a furnace; and oils are called *fixed* when they do not evaporate on simple exposure to the atmosphere. See **Oil**.—3. Lively; brisk; gay; full of spirit; airy; hence, fickle; apt to change; as, a *volatile* temper.

Skr. *utkā*, fire.] A hill or mountain more or less perfectly cone-shaped, with a circular cup-like opening or basin (called a crater) at its summit; popularly termed a *burning mountain*. In the centre of the crater is the mouth of a perpendicular shaft, which sends out clouds of hot vapour, gases, and, at times of increased activity, showers of ashes, hot fragments of rocks, and streams of fiery liquid rocks, called *lava*, which flow down the slopes of the mountain. The gradual accumulation of these ejected materials

Section of an active Volcano.

around the crater forms a succession of concentric layers which explains the conical shape. The mountain has often several subsidiary cones connected with the principal, and lava may flow out from various mouths or vents. The flames described as issuing from the crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scoræ, and ashes. Nearly all active volcanoes have times of relative repose, interrupted, often at great intervals, by periods of increased activity, which terminate in a violent ejection of incandescent matter from the interior. The volcano is then said to be in a state of eruption, which is usually foreboded by loud subterranean noises, like explosions of distant artillery, shocks of earthquake, &c. The most important European volcanoes are Vesuvius, near Naples, whose sudden eruption in 79 A.D. overwhelmed Pompeii, Herculaneum, and other cities; Etna, in the island of Sicily; and Hecla in Iceland.

A volcano has been described by Sir Charles Lyell as 'a more or less perfectly conical hill or mountain, formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication with the interior of the earth, by which the ejections are effected.' *Page.*

Some are terrestrial, others aquatic. The common vole (*A. agrestis*), the meadow-mouse or short-tailed field-mouse, is injurious to young plantations, devouring the bark and destroying the roots. The water-vole or water-rat (*A. amphibius*) is much larger, and swims well though its feet are not webbed. A black variety of the water-vole common in Britain is the *A. atra*. There are many other species in the Old and New Worlds. See **ARVICOLA**.

'Will' is an ambiguous word, being sometimes put for the 'faculty' of willing; sometimes for the 'act' of that faculty, besides other meanings. A very simple *volumenometer* consists of a globular flask with a narrow neck, about 12 inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper, for admitting the solid body to be measured. The instrument being filled to the mark 0° on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. Familiar examples are seen in eddies, whirlpools, waterspouts, whirlwinds, and on a larger scale in cyclones and storms generally. It is more particularly applied to a whirlpool or a body of water moving with a circular motion, and forming a cavity in the centre, into which all bodies coming within its influence are drawn and engulfed. 'Roll in her vortex and her power confess.' *Pope.*

'The huge vortex of Norse darkness.' *Carlyle.*—2. In the Cartesian philos. a collection of material particles, forming a fluid or ether, endowed with a rapid rotatory motion about an axis, and filling all space, and by which Descartes accounted for the motions of the universe. This theory attracted much attention at one time, but is now entirely discredited.—**Vortex ring**, in physics, a vortical molecular filament or column returning into itself so as to form a ring composed of a number of small rotating circles placed side by side, like beads on a string, as the singular smoke-rings which are sometimes produced when a cannon is fired, or when a smoker skillfully emits a puff of tobacco smoke. Recent labours in the theoretical investigation of the motion of vortices, more particularly the theorems relating to vortex filaments rotating round a central axis in a frictionless or perfect fluid, have suggested the possibility of founding on them a new form of the atomic theory.

Vowel (vou'el), *n.* [Fr. *voyelle*, from L. *vocalis*, lit. a vocal letter, from *vox*, *vocis*, the voice. See **VOICE**.] 1. A sound uttered by simply opening the mouth or vocal organs; a sound uttered when the vocal organs are merely in an open position, as the sound of *a* or *o*. Vowels are distinguished from consonants in that the former can be pronounced by themselves, while consonants require to be sounded with the aid of a vowel.

When the voice is not further modified by contact, partial or complete, of the lips or tongue, but flows through an open channel without any friction or hissing, then we have *vowel* sound. When on the other hand the sound is not complete until the action of some part of the organs of the mouth has ceased,

then we have produced what we may call *consonantal* sound. Briefly, 'a vowel' is the result of an open position of the oral organs; an articulation (this is Mr. Bell's term for *consonant*) is the result of an opening action of the organ.' *Felle.*

A kind of vulcanized caoutchouc differing from ordinary vulcanized caoutchouc in containing a larger proportion of sulphur—from 30 to 60 per cent.—and in being made at a higher temperature. It is of a brownish-black colour, is hard and tough, cuts easily, and takes a good polish, on which account it is largely used for making into combs, brooches, bracelets, and many other ornaments. It is not affected by water or any of the other caoutchouc solvents. As it is especially distinguished by the large quantity of electricity which it evolves when rubbed, it is much used in the construction of electric machines. Called also *Ebonite*.—2. A name sometimes given to vulcanic garnet or pyroxene, from its being found in ejected blocks and lavas.

Vulcanization (vul'kan-iz-ā'shon), *n.* A method of treating caoutchouc or india-rubber with some form of sulphur to effect certain changes in its properties, and yield a soft (*vulcanized india-rubber*) or a hard (*vulcanite*) product. This was originally effected by dipping the rubber in melted sulphur and heating it to nearly 300°. Several other methods have been employed, probably the best of which for general purposes consists in mechanically mixing the rubber at a moderate heat with flowers of sulphur, and subsequently 'curing' it in superheated steam at from 250° to 300° Fahr. Other ingredients, as litharge, white-lead, zinc-white, whiting, &c., are added to the sulphur to give colour, softness, &c., to the rubber. The substance thus formed possesses the following properties: it remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized india-rubber is employed with great success for very many useful purposes: for waterproofing cloth, for boots, shoes, mats, toys, belting, buffers, wheel-tires, washers, valves, pipes, fire-hose, medical and surgical appliances, &c. Hard vulcanized rubber is known as *ebonite* or *vulcanite*. See **VULCANITE**.

dead carcasses and offal. Their geographical distribution is confined chiefly to warm countries, where they act as scavengers to purify the earth from the putrid carcasses with which it would otherwise be encum-

bered. The Vulturidæ are divided into several genera, the chief being Vultur, Cathartes, Sarcorhamphus, Neophron, and Gypætes, of which the last approaches to the Falconidæ in its characters and habits, having the head feathered and not always feeding on carrion, but often attacking living animals. The griffon vulture (*V. fulvus*) inhabits the mountainous parts of the south of Europe, Silesia, Spain, the Alps, the Pyrenees, Turkey, and the Grecian Archipelago. The cinereous or brown vulture (*V. cinereus*) inhabits lofty mountains in Europe, and the forests of Hungary, the Tyrol, and the Pyrenees, the south of Spain and Italy. The bearded vulture, or lümmergeyer (*Gypætes barbatus*), inhabits the highest mountains of Europe, Asia, and Africa. The Egyptian vulture is the *Neophron percnopterus*. In some recent systems the vultures of the Old World are grouped into one family, Gypætidæ, while those of the New World form another, Cathartidæ, the two families being marked by various distinctive peculiarities.

W.

W is the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. (See V and U.) The name, double u, however, being given to the letter from its form or composition, and not from its sound, is not a very suitable one. In the Anglo-Saxon alphabet it had a character with a distinctive form of its own, the more modern letter being adopted in the thirteenth century. This letter is used to represent two sounds, the one which distinctively belongs to it being that which it has at the beginning of a syllable and followed by a vowel, as in *ware, will, dwell, away, forward, &c.* This sound has somewhat the character of a vowel, and *w* in such a position is hence often spoken of as a semi-vowel. It is formed by opening the mouth with a close circular configuration of the lips, the organs having exactly the position they have in pronouncing the *oo* of *foot*. Yet it has not really a vowel sound in such cases, and *well*, for instance, is not equivalent to *oo-ell*. This fact is more conclusively shown by such words as *wood, wool, woman*, in which the *oo*-sound is distinctly preceded by a consonant. Its true character is also shown by the definitions given by the best modern phonologists for a consonant and a vowel. Thus, Mr. Melville Bell defines a vowel as the result of an open position of the oral organs; an articulation (or consonant) as the result of an opening action of the organs. It is this opening action that marks *w* as distinct from *oo*, yet pronounced in a drawing manner it is hardly different in force. At the end of syllables, in which position it is always preceded by a vowel, it has either no force at all (or at most lengthens the vowel), as in *law, lawful, to sow, low, hollow, &c.*, or it forms the second element in a diphthong, as in *none, won, new, few*, being then really a vowel, and equivalent to the *u* in *neutral, bough, &c.* Followed by *r* it is initial in a considerable number of English words, as *wrap, write, wrong, &c.* It is now silent in such positions, though it was long sounded, as it still is in Scotland. *Wh* is another initial combination, as in *what, where, whale, whet, &c.* In Anglo-Saxon these words were spelt with *hw* (which in cognate words represents Icel. *hv*, L. *qu* initial), there being a guttural sound originally heard before the *w*. In Scotland, in such words as *what, whale*, a very decided guttural is heard before *w*. With the best speakers of modern English, however, *wh* seems to be *w* with a slight aspiration after it, though there is a tendency to pronounce *w* pure and simple. In Anglo-Saxon *wl* was also an initial sound; thus *lisp* was originally *wlisp*, the *w* having

disappeared. It has also disappeared from *tree, knee, four, ooze, such, sister, &c.*; and, as above mentioned, it is not heard in many words, to which may be added such as *word, two, answer, gunwale, &c.* In many words it has taken the place of an older *g*, as in *law, man, &c.* (See G.) It has intruded itself into *whole, where*. A *w* coming before *a* often has the effect of giving the latter an *o*-sound (comp. *wad, wallow, water, &c.*); *qu* (= *kw*) has the same effect.—As an abbreviation *W* stands for west; *W.N.W.* for west-north-west; *W.S.W.* for west-south-west, &c.

Wager (wā'jēr), *n.* [O. Fr. *wageure*, *gageure*, from L.L. *radiatura*. See WAGE, *v. t.*]

1. Something deposited, laid, or hazarded on the event of a contest or some unsettled question; something staked by each of two parties in support of his own opinion concerning a future or an unknown event; a stake. The party whose opinion proves to be correct receives what has been staked by both. By statutes of England, Scotland, and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and the wager or money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honour, and if paid it is in the eye of the law the same thing as giving a gratuity.

Besides these plates for horse races, the *wagers* may be as the persons please. *Sir W. Temple*.

For most men (till by losing rendered sager)
Will back their own opinion by a *wager*. *Byron*.

2. An occasion on which two parties bet; a bet. — 3. That on which bets are laid; the subject of a bet.

Sir P. Sidney.

4. In *law*, an offer to make oath of innocence or non-indebtedness; or the act of making oath, together with the oaths of eleven compurgators, to fortify the defendant's oath. — *Wager of battle* or *battle*. See under **BATTLE**. — *Wager of law* was formerly a mode of trial, whereby in an action of debt brought upon a simple contract between the parties, without any deed or record, the defendant might discharge himself by taking an oath that he owed not the plaintiff anything; but he required to bring with him eleven persons of his neighbours, called *compurgators*, who were to avow upon their oath that they believed in their consciences that he declared the truth. — *Wager policy*. See under **WAGERING**.

Such policies are generally held to be null and void.

Wages (wā'jēs), *n. pl.* [O. Fr. *wage*, *gage*, a pledge, security. *Wages* are what the person hiring another has pledged himself to give. See **WAGE**.] The payment given for services performed; the price paid for labour; the return made or compensation paid to those employed to perform any kind of labour or service by their employers; hire; pay; need; recompense. Though a plural, *wages* sometimes has a verb in the singular.

The *wages* of sin is death. Rom. vi. 23.

Thou thy worldly task hast done,

Home art gone, and ta'en thy *wages*. *Shak.*

Wages, then, depend mainly upon the demand and supply of labour.

F. S. Mill.

Note. In ordinary language the term *wages* is usually restricted to the remuneration for mechanical or muscular labour, especially to that which is ordinarily paid at short intervals, as weekly or fortnightly, to workmen. Correctly speaking, however, what is called the *fees* of professional men, as lawyers, physicians, &c., the *salaries* of public functionaries, business men, &c., the *pay* of military and naval men, and the like, are all wages. On the other hand, when an author publishes a book, or a shoemaker sells a pair of shoes, the sums received are not wages, though to the seller they are virtually the same thing.

Wagon, **Waggon** (wā'jēn), *n.* [A. Sax. *wagen*, *wagpa*, *wægn*, which in later times became *wain*; D. and G. *wagen*, Icel. and Sw. *wagn*, Dan. *vogn*; lit. a carriage, what carries, from root seen in A. Sax. *regan*, Icel. *rega*, to carry; cog. Skr. *vah*, L. *veh*, to carry (whence *vehicle*).] Akin also to *way*, *wag*, *weigh*, &c. *Skeat* remarks that *wagon* cannot come directly from the A. Sax., *wægn* being the word that has directly descended from it (with same change of form as in *roin*, *hail*, *nail*, &c.). He therefore regards *wagon* as borrowed from the Dutch in the fifteenth or sixteenth century. Yet it seems strange that with *wain* in common usage we should have borrowed another word of the same signification.] 1. A four-wheeled vehicle for the transport of heavy loads. The English wagon is usually a strong heavy machine drawn by two horses yoked abreast. The fore wheels are much smaller than the hind pair, and their axle is swivelled to the body of the wagon to facilitate turning. The bodies of most wagons are set on springs on account of the weight of the vehicle and the absence of the steady power of the horse, who expends his force in pulling only, the weight being distributed over the four wheels. Common varieties of the wagon are the brewer's dray, the railway lorry, and the agricultural wain. Wagons, such as are used by carriers, are frequently provided with wooden bows, over which a covering of heavy canvas or the like may be stretched to protect their contents from rain. The ends of the bows are inserted in staples on each side of the vehicle, so that tilt and bows can be readily removed when not required. In the United States wagons of a much lighter build, and drawn by one horse only, are much used for the conveyance of passengers and light commodities. — 2. An open four-wheeled vehicle for the conveyance of goods on railways. 3. † A chariot. 'Her *waggon* spokes made of long spinners' legs.' *Shak.*

2. The state of forbearing sleep, especially for a solemn or festive purpose; vigils; specifically, the feast of the dedication of a parish church, formerly kept by watching all night. Each church when consecrated was dedicated to a saint, and on the anniversary of that day the parish wake was kept; and in many places there was a second wake on the birth-day of the saint. Tents were erected in the churchyard to supply refreshments to the crowd on the morrow, which was kept as a holiday. Through the large attendance from neighbouring parishes at wakes, devotion and reverence gradually diminished, until they ultimately became mere fairs or markets, characterized by merry-making and often disgraced by indulgence and riot; hence, a merry-making; a festive gathering. 'He haunts *wakes*, fairs, and bear-baitings.' *Shak.*

3. The watching of a dead body prior to burial by the friends and neighbours of the deceased, a custom which prevails in Ireland, and was formerly prevalent in Scotland. It most probably originated in a superstitious notion with respect to the danger of a dead body being carried off by some of the agents of the invisible world, or exposed to the ominous liberties of brute animals. Such wakes very early degenerated into scenes of festivity, extremely incongruous with the melancholy occasion.

In Ireland a *wake* is a midnight meeting, held professedly for the indulgence of holy sorrow, but usually it is converted into orgies of unholy joy. *Miss Edgeworth.*

The following explanation of the phrase appeared in the *Saturday Review*. 'Years ago there was a person named *Walker*, an aquiline-nosed Jew, who exhibited an orrery, which he called by the erudite name of Eidouranian. He was also a popular lecturer on astronomy, and often invited his pupils, telescope in hand, to take a sight at the moon and stars. The lecturer's phrase struck the schoolboy auditory, who frequently 'took a sight' with that gesture of outstretched arm and adjustment to nose and eye which was the first garnish of the popular saying. The next step was to assume phrase and gesture as the outward and visible mode of knowledge in general.' Other explanations have been offered equally problematical.

trouble; akin to Mod. G. *wirren*, to embroil, confuse; D. *war*, entanglement, confusion, *warren*, to disturb, to embroil. Supposed to be connected with *woese*, through the sense of entanglement or confusion.] 1. A contest between nations or states (*international war*), or between parties in the same state (*civil war*), carried on by force of arms, usually arising, in the first case, from disputes about territorial possessions and frontiers, unjust dealings with the subjects of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest, rarely nowadays from the whim of a despot; in the second case, from the claims of rival contenders for supreme power in the state, or for the establishment of some important point connected with civil or religious liberty. In all cases the aim of each contending party is to overthrow or weaken the enemy by the defeat or dispersion of his army or navy, the occupation of important parts of his country, such as the capital or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. International or public war is always understood to be authorized by the monarch or sovereign power of the nations; when it is carried into the territories of a hitherto friendly power it is called *aggressive* or *offensive war*, and when carried on to resist such aggression it is called *defensive*. Previous to the outbreak of hostilities between states, the power taking the initiatory step issues a *declaration of war*, which now usually takes the form of an explanatory manifesto addressed to neutral governments. During the progress of the struggle certain *laws, usages, or rights of war* have come to be generally recognized; such laws permitting the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation, are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy; and generally the tendency in all laws and usages of war is becoming gradually more favourable to the cause of humanity at large.—2. Impregnable. *Milton*.

5. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P.M.), the second or 'middle watch' (10 P.M. to 2 A.M.), and the third, or 'morning watch' (from 2 A.M. till sunrise). After the establishment of the Roman power they were increased to four, which were named according to their numerical order, as first, second, &c., or by the terms *even*, *midnight*, *cock-crowing*, and *morning*, these terminating respectively at 9 P.M., midnight, 3 A.M., and 6 A.M. See *Ex. xiv. 24*; *Judg. vii. 19*; *Lam. ii. 19*; and *Mat. xiv. 25*; *Mark xiii. 35*. 6. *Naut.* (a) the period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 P.M., the time is divided into two short or *dog-watches* in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 P.M. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the first *night watch*, from 12 to 4 A.M. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches. *Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at

anchor or in port. (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two portions: the *star-board watch*, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the *port-watch*, which in the merchant service is commanded by the chief mate. In the royal navy these watches are commanded by the lieutenants successively.—7. Anything by which the progress of time is perceived and measured; as, (a)† a candle marked out into sections, each of which was a certain time in burning.

Fetch me a bowl of wine. Give me a *watch*. *Shak*.

(b) A small time-piece, now universally circular in shape, to be carried in the pocket or about the person. The essential parts of a watch are the dial on which the hours, minutes, and seconds are marked, the bands which move round the dial pointing to these divisions, the train of wheels which carry round the hands, &c., the balance which regulates the motion of the wheels, and the coiled spring (the mainspring), whose elastic force produces the motion of the whole machinery, the movement being inclosed in a protecting case usually of gold or silver.—A repeating watch or repeater has in addition a small bell, gong, or other sounding object on which the hours, half-hours, quarters, &c., are struck on the compression of a spring. A *chronometer watch* or *pocket chronometer* is one of the finest kinds of watches fitted with a compensation balance and other devices which prevent the variations of temperature from affecting the regular movement of the watch. (See **CHRONOMETER**.) Watches were invented at Nuremberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus *Malvolio* remarks in anticipation of his great fortune.

I frown the while; and perchance wind up my watch, or play with my—some rich jewel. *Shak*.

8. In *pottery*, a trial piece of clay so placed in a kiln that it can be readily withdrawn to enable the workmen to judge by its appearance of the heat of the fire, and the condition of the ware remaining in the saggars.—The *Black Watch*, a name originally given to certain armed companies, wearing a dark tarten, raised in Scotland about 1663 to keep the Highlanders in order. In 1739 they were formed into a regular regiment, the 42nd, long famous as the *Black Watch*. Latterly this and the 73rd regiment have been combined to form the first and second battalions of the *Black Watch*, otherwise the *Royal Highlanders*.—*Watch and ward*, the ancient custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between *watch* and *ward*, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase *to keep watch and ward*, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

Water (wä'tér), *n.* [O.E. *weatere*, *wæter*, *weater*, A. Sax. *water*; O. Sax. *water*, D. and L.G. *water*, G. *wasser*. The Scandinavian forms are somewhat different: Dan. *vand* (for *vadn*), Icel. *vatn*, Sw. *vatten*; similarly Goth. *vato* (pl. *vatna*). From a root *wad*, *ud*, seen also in L. *udus*, wet, *unda*, a wave; Gr. *hýdôr*, skr. *udan*, water. Akín *vet*. *Otter* is also from this root, lit. the water animal.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 513 millionths of its bulk. Although water is colourless in small quantities, it is blue like the atmosphere when viewed in mass. It assumes the solid form,

that of ice or snow, at 32° F., and all lower temperatures; and it takes the form of vapour or steam at 212° F. under a pressure of 29.9 ins. of mercury, and retains that form at all higher temperatures. Under ordinary conditions water possesses the liquid form only at temperatures lying between 32° and 212°. It is, however, possible to cool water very considerably below 32° F. and yet maintain it in the liquid form; the vessel containing the water must be perfectly clean, and the water must be maintained in a state of perfect rest. Water may also be heated, under pressure, many degrees above 212° F. without passing into the state of steam. The specific gravity of water is 1 at 39° 2 F., being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 62° F., and 29.9 inches, barometrical pressure, weighs 252.458 grains. Distilled water is 815 times heavier than atmospheric air. Water is at its greatest density at 39° 2 F. (=4° C.), and in this respect it presents a singular exception to the general law of expansion by heat. If water at 39° 2 F. be cooled, it expands as it cools till reduced to 32°, when it solidifies; and if water at 39° 2 F. be heated, it expands as the temperature increases in accordance with the general law. In a chemical point of view water exhibits to itself neither acid nor basic properties; but it combines with both acids and bases forming *hydrates*; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids water is the most powerful and general solvent, and on this important property its use depends. Without water not only the operations of the chemist but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears as spring or river water, it is always more or less charged with salts derived from the earth, such as sea-salt, gypsum, and chalk. When the proportion of these is small the water is called *soft*, when larger it is called *hard water*. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasant to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is reposit in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas, and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and uniting with the air in the state of vapour, is wafted over the earth ready to be precipitated in the form of rain, snow, or hail. Water is a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to 1 volume of the latter; or by weight it is composed of 2 parts of hydrogen united with 16 parts of oxygen. Its formula is H₂O.—2. Water collected in a body; the ocean; a sea; a lake; a river; any collection of water. 'Such as travel by land or by water.' *Common Prayer.*

Water-spout (wā'tér-spout), *n.* A remarkable meteorological phenomenon frequently observed at sea, and exactly analogous to the whirlwinds experienced on land. It occurs when opposite winds of different temperatures meet in the upper atmosphere, whereby a great amount of vapour is condensed into a thick black cloud, to which a vortical motion is given. This vortical motion causes it to take the form of a vast funnel, which, descending near the surface of the sea, draws up the water in its vortex, which joins in its whirling motion. The whole column, which after the junction extends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides.

Water-spout.

When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea in a heavy shower of rain. Sudden gusts of wind, from all points of the compass, are very common in the vicinity of water-spouts. What are sometimes called *water-spouts on land* are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They occur generally during thunder-storms, and differ only from severe hail-storms in point of temperature.

See *WAVE*, *v.t.*] 1. An undulation, swell, or ridge on the surface of water or other liquid resulting from the oscillatory motion of its component particles, when disturbed from their position of rest by any force; especially, the rolling swell produced on the surface of the sea or other large body of water by the action of the wind; a billow; a surge. When the surface of a liquid is pressed down at any part, the adjoining parts rise, but sink again by the action of gravity; and acquiring a momentum proportionate to the mass and height, descend below the original level, displacing other parts near them, which rise and sink in a similar manner. The result is a reciprocating motion, the particles to which the primitive impulse was communicated being alternately the lowest and the highest, forming the series of ridges and hollows called *waves*. Where the depth of the liquid is invariable over its extent, or sufficient to allow the oscillations to proceed unimpeded, no progressive motion takes place, each ridge or column being kept in its place by the pressure of the adjacent columns. Should, however, free oscillation be prevented, as by the shelving of the shore, the columns in the deep water are not balanced by those in the shallower parts, and they thus acquire a progressive motion towards the latter, or take the form of *breakers*, hence the waves always roll in a direction towards the shore, no matter from what point the wind may blow. When waves are produced by the disturbance of a small quantity of the liquid, as when a pebble is thrown into a pool, they appear to advance from the disturbed point in widening concentric circles, the height of the wave decreasing gradually as it recedes from the centre; but there is no progressive motion of the liquid itself, as is shown by any body floating on its surface. The whole seems to roll onwards, but, in reality, each particle of water only oscillates with a vertical ascent and descent. The height of the wave depends in a great measure on the depth of the water in which it is produced. The waves of the ocean have been known in some instances to have reached a height of 43 feet, measured from the trough to the crest. The horizontal pressure of a strong Atlantic wave, as tested by Stephenson's marine dynamometer, has been recorded as high as 3 tons to the square foot. It is a matter of common observation that a wave of much greater dimension than others occurs at certain intervals, rolling much higher on the shore than those im-

mediately preceding or following it, or breaking with immense force over the decks of vessels on the open sea. This is caused when several coexisting series of waves moving with different velocities meet, and the crests of two or three of them become superimposed upon each other. Several series of waves moving in different directions may also coexist without destroying each other, giving rise to the chopping seas or cross swells so troublesome to mariners. The length of a wave is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A wave is said to have passed through its length when its elevated part has arrived at the place where the elevated part of the next wave stood before; or, the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a wave's motion or the time of an undulation. The velocity of a wave is the rate at which the points of greatest elevation or depression seem to change their places.—*Tidal wave*. See *TIDE-WAVE*.—2. In *physics*, a vibration propagated from one set of particles of an elastic medium to the adjoining set, and so on; sometimes, but not always, accompanied with a small permanent displacement of such particles. The theory of the motion of waves is of great importance in physical science; since, not only is it connected with the phenomena of the waves of the ocean ordinarily produced by the wind, the tidal wave, &c., it has also a close relation to the phenomena of undulating musical strings, the undulations in solids, as in earthquake waves, &c., while we know that sounds in air are propagated as waves, and that even light is now generally held to be a form of wave-motion. See *SOUND*, *LIGHT*, *UNDULATORY*.—3. *Water*. [Poetical.]

A thick, viscous, tenacious substance, excreted by bees from their bodies, and employed in the construction of their cells; usually called *Bees'-wax*. Its native colour is yellow, and it has a peculiar smell resembling honey, which is derived from the honey deposited in the cells. When bleached and freed from impurities, wax is white, brittle, and translucent in thin segments; it has neither taste nor smell; it has a specific gravity of from 0.960 to 0.963. It melts at 155° and softens at 86°, becoming so plastic that it may be moulded by the hand into any form. It is a mixture of three substances, called respectively myricin, cerotic acid, and cerolin, in very variable proportions. These substances are themselves composed of carbon, hydrogen, and oxygen. Wax is extensively employed both in its original and bleached state; in the latter state it is used for candles, and in numerous cerates, ointments, and plasters. It is also used in forming figures or images, busts, &c., in the preparation of anatomical models, in the preparation of artificial fruit, flowers, &c. In statuary it is used in making models for the metal cast.—2. Any substance resembling wax in appearance, consistence, plasticity, or other properties; as, (a) a vegetable product which may be regarded as a concrete fixed oil; the principal varieties being Chinese wax, cow-tree wax, Cuba wax, and Japan wax. It may be obtained from the pollen of many flowers, and it forms a part of the green fecula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit and the upper surface of the leaves of many trees, as in the wax-palm and wax-myrtle. Called also *Vegetable Wax*. (b) A mineral product, one of certain fossil hydrocarbons which occur in small quantities generally in the carboniferous formation; called more fully *Mineral Wax*. The most familiarly known variety is ozocerite (which see). (c) A thick tenacious substance excreted in the ear; ear-wax. (d) A substance found on the hinder legs of bees, derived from the pollen of flowers. This was long supposed to be the substance from which bees elaborated the wax for their cells, but this notion is now found to be erroneous. The pollen collected by bees serves for the nourishment of their larvae. (e) A substance used in sealing letters. See **SEALING-WAX**. (f) A thick resinous substance used by shoemakers for rubbing their thread.

The wax, known as Chinese wax or *pela*, is collected from the plants, melted, and strained, and is then made into a very fine kind of candles which are used by only the higher classes in China. above the sea-level, among rugged precipices. It grows to the height of 180 feet. The trunk is marked by rings, caused by the falling off of the leaves, which are 15 to 20 feet long, and is covered with a thick secretion, consisting of two-thirds resin and one-third wax. This substance is also exuded from the leaves, is whitish, almost inodorous, except when heated, when it gives out a resinous odour. In the region in which it grows

Originally, therefore, *we = ma-sma = I + that* (or *he*). See *U's.* I and another or others; I and he or she, or I and they. It is sometimes, like *they*, vaguely used for society, people in general, the world, &c., but when the speaker or writer uses *we* he identifies himself more or less directly with the statement; when he uses *they* he implies no such identification. The plural style is also used by kings and other potentates, and is said to have been first used in his edicts by King John of England, according to others by Richard I. The French and German sovereigns followed the example about the beginning of the thirteenth century.

We charge you, on allegiance to yourself, To hold your slaughtering hands. *Shak.*

Weavers were supposed to be generally good singers. Their trade, being sedentary, they had an opportunity of practising, and sometimes in parts. . . . Many of the *weavers* in Queen Elizabeth's days were Flemish Calvinists, who fled from the persecution of the Duke of Alva, and were therefore particularly given to singing psalms. Hence the exclamation of Falstaff.

[The correct reading is 'sing psalms or anything.'—2. One of the aquatic insects of the genus *Gyrinus*; the whirlwig (which see).—3. A name given to insectivorous birds of various genera, belonging to the conirostral section of the order, and forming a group or sub-family (*Ploceinae*) of the Fringillidae or finches. Yellow-crowned Weaver and Nest (*P. icterocephalus*).

the remarkable structure of their nests, which are woven in a very wonderful manner of various vegetable substances. Some species build their nests separate and singly, and hang them from slender branches of trees and shrubs, but others build in companies, numerous nests suspended from the branches of a tree being under one roof, though each one forms a separate compartment and has a separate entrance. They are natives of the warmer parts of Asia, of Africa, and of Australia, none being found in Europe or America. The *Ploceus icterocephalus*, or yellow-crowned weaver, is a native of South Africa, and constructs an isolated pensile kidney-shaped nest, about 7 inches long by $\frac{1}{2}$ broad, with an opening in the side. Naturalists are not quite agreed

as to whether the nests of the weaver-bird are built in their own peculiar manner as a means of preservation against the rain, or against the attacks of serpents and small quadrupeds, probably the latter.

Weaving (wēv'ing), *n.* The act of one who weaves; the act or art of producing cloth or other textile fabrics by means of a loom from the combination of threads or filaments. In all kinds of weaving, whether plain or figured, one system of threads, called the *warp* or *wef*, is made to pass alternately under and over another system of threads called the *warp*, *wef*, or *chain*. The essential operations are the successive raising of certain threads of the *warp* and the depression of others so as to form a decussation or *shed* for the passage of the *wef* yarn, which is then beaten up by means of a *lay* or *batten*. Weaving is performed by the hand in what are called *hand-loom*s, or by steam in what are called *power-loom*s, but the general arrangements for both are to a certain extent the same. (See LOOM, JACQUARD.) Weaving, in the most general sense of the term, comprehends not only those textile fabrics which are prepared in the loom, but also net-work, lace-work, &c.

A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surfaces, as in the figure, where the triangles ABE, DCF are the ends, the rectangles ADEF, BCEF the sides, and the rectangle ABCD the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back, D C, to the length of the side, D E, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration DFC. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied.—2. A mass of metal, especially if resembling a wedge in form. 'A wedge of gold of fifty shekels weight.' Josh. vii. 21. 'Wedges of gold, great anchors, heaps of pearls.' Shak.—3. Something in the form of a wedge.

Some of these are constructed on the principle of the lever or steelyard, others on that of a combination of levers, and others on that of the spring-balance. A special feature of the majority of them is the large platform, on a level with or raised but as little as possible above the ground, so that vehicles or heavy goods to be weighed thereon may be easily transferred to and from it.

Weight (wāt), *n.* [O. E. *weght*, *wight*, A. Sax. *ge-wiht*, from *wegan*. See *WEIGH*.] 1. That property of bodies by which they tend toward the centre of the earth; gravity; as, a body has *weight* or has no appreciable *weight*.—2. The measure of the force of gravity, as determined for any particular body; the measure of the force by which any body or a given portion of any substance gravitates or is attracted to the earth; in a more popular sense, the amount which anything weighs; the quantity of matter as estimated by the balance or expressed numerically with reference to some standard unit; as, a bar of metal having a *weight* of 5 lbs.; a load of 3 tons *weight*. In determining weight in cases where very great precision is desired, due account must be taken of temperature, elevation, and latitude. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it; therefore, as the density of the air is variable—air when warmed expanding very much more than any solid—a piece of metal appears to weigh more in warm than in cold weather. Moreover air becomes more dense by an increase of pressure, consequently when the barometer is high all heavy bodies become apparently lighter; when the barometer is low they become apparently heavier.

meter is low they become apparently heavier. Now suppose a pound of iron and a pound of platinum are adjusted in light air and again compared in dense air, a slight change may be observed. For as a pound of iron is bulkier than a pound of platinum it displaces more air, and its apparent weight undergoes a greater change than does that of platinum. Hence in fixing exact standards of weight a particular temperature and pressure of air must be specified; thus the standard brass pound of Britain is directed to be used when the Fahrenheit thermometer stands at 62° and the barometer at 30". In the second place it must be observed that the attraction which the earth exerts upon bodies placed near it decreases with their distances from its centre, being inversely as the squares of the distances; thus a body weighing a pound at the level of the sea will weigh somewhat less when tested properly at the top of a mountain. In the third place, since the earth has a diurnal motion on its axis, every substance placed on it has a centrifugal tendency which in some degree modifies what otherwise would have been its gravitation; thus centrifugal tendency produces the earth's oblateness, and causes a variation in the intensity of gravitation from one latitude to another, a stone being heavier at lat. 60° N. for instance than at the equator.—*Standard of weight*, the unit of mass legally recognized in a state, and by which the weight of other bodies may be determined, and all other weights used in commerce adjusted. In Britain a certain brass weight is by statute settled as the imperial standard troy pound. This pound contains 5760 grains, and is divided into 12 ounces; the pound avoirdupois contains 7000 such grains, and is divided into 16 ounces. The standard of weight (as also that of length) is the same in the United States. Standard weights are easily connected with standard measures; the weight of a cubic inch of distilled water, for instance, may be taken as a standard. See *AVOIRDUPOIS*, *TROY*, &c.—3. A certain mass of brass, iron, lead, or other metal or substance to be used for determining the weight of other bodies; as, an ounce weight; a pound weight; a 56 lb. weight.—4. A particular scale, system, or mode of estimating the relative heaviness of bodies; as, avoirdupois weight; troy weight; apothecaries' weight.—5. A heavy mass; something heavy.

They are characterized by having fin-like anterior extremities, the posterior extremities having their place supplied by a large horizontal caudal fin or tail, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance that not only the vulgar, but even some of the earlier zoologists regarded them as belonging to that class. The whales are usually divided into two families, the *Balenidae* and the *Physeteridae* or *Catodontidae*. The *Balenidae*, or whalebone whales, are distinguished by the absence of teeth, by the presence of baleen or whalebone, and by the nostrils being placed on the top of the head. The typical representative of this family is the common or Greenland whale (*Balaena mysticetus*), so valuable on account of the oil and whalebone which it furnishes. It is principally found in the Arctic seas, but it is

also found in considerable numbers in many other parts of the world. Its length is usually about 60 feet, and its greatest circum-

Greenland Whale (*Balaena mysticetus*).

ference from 30 to 40 feet. The razor-backed whale, or northern rorqual, is the *Balaenoptera borealis*. It often measures about 100 feet in length, and from 30 to 35 feet in circumference (See RORQUAL.) The Physeteridae or Catodontidae are characterized by the fact that the palate is destitute of baleen, and the lower jaw possesses a series of pointed conical teeth. The best known species of this family is the sperm-whale or cachalot (*Physeter or Catodon macrocephalus*), which averages from 50 to 70 feet in length. (See CACHALOT, SPERMACETI, where is cut of spermaceti whale.) Some species of Delphinidae are also known as whales. See BELUGA, CAALING-WHALE. —*Very like a whale*, a phrase applied to anything very improbable, and implying disbelief in what is stated. It takes its origin from a well-known passage in *Hamlet*, act iii. sc. 2. — *Whale's bone*, an old term for ivory, perhaps from the circumstance that the ivory of Western Europe in the middle ages was the tooth of the walrus, which may have been confounded with the whale.

might have been given to *wheat*. It might have been called areal, nutritious, graceful, waving, the incense of the earth.' (In Sanskrit it was called the incense of the earth, *go-dhūma*.) 'But it was simply called the *white*, the white colour of its grain seeming to distinguish it best from those plants with which otherwise it had the greatest similarity. For this is one of the secrets of onomatopoeisis—that it should express, not the most important or specific quality, but that which strikes our fancy.' *Max Müller*.] A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Of cultivated wheats there are many varieties, the differences, however, being mostly due to soil, climate, and mode of cultivation. Three primary varieties may be mentioned: (a) *T. hybernium* (*muticum*), winter or un-bearded wheat; (b) *T. aestivum* (*aristatum*), summer or bearded wheat; (c) *T. Spelta* (*ad-hærens*), spelt or German wheat, which is of much less value than the others, but grows on poorer soils and more elevated localities. White wheat and red wheat are names applied according to the colour of the grain, the red sorts being generally harder than the white, but of inferior quality, and the yield is less. Winter wheat is sown in the autumn, with the view of being harvested the following year; summer wheat is sown in the spring of the year in which it is reaped. The best English wheat yields from 75 to 85 per cent of fine flour, the inferior kinds only from 54 to 68 per cent. See *TRITICUM*.

to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. Wheel (whêl), *n.* [A. Sax. *hweol*, contr. from *hweoval*; D. *wiel*, Dan. *hjul*, Icel. *hjól*, also *hvel*: connections doubtful.] 1. A circular frame or solid disc turning on an axis. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery or circular ring. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. They receive different names according to their forms and uses; as, *balance-wheel*, *cog-wheel*, *crown-wheel*, *dash-wheel*, *eccentric*, *fly-wheel*, *friction-wheel*, *lantern-wheel*, *paddle-wheel*, *pinion*, *pin-wheel*, *planet-wheel*, *ratchet-wheel*, *scope-wheel*, *spur-wheel*, *trawl-wheel*, *turbine*, &c., which are described at more or less length according to their importance under these headings.

(d) An instrument of torture generally used for criminals of the most atrocious class, formerly employed in France and Germany. In some places it consisted of a carriage-wheel on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round the executioner broke the wretch's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to the sufferings of his victim by two or three severe blows, called *coups de grâce* (mercy strokes), on the chest or stomach, or by strangling him. In Germany its use lingered down till the beginning of the present century.

—*Wheel and axle*, one of the mechanical powers, consisting in its primary form of a cylindrical axle on which a wheel, concentric with the axle, is firmly fastened. By reference to figs. 1, 2, it will be seen that this power resolves itself into a lever of the

Fig. 1.

Fig. 2.

first order, in which the weight and power are at the ends, and the fulcrum between them. C is the centre or fulcrum; AC and CB are the semi-diameters of the wheel and the axle; and on the principle of the lever the power is to the weight as AC is to CB. The wheel is grooved and carries a coil of rope; another rope is secured to the axle; and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axle or cylinder. In a great many cases a crank takes the place of the wheel, and the circumference described by the handle is substituted for the circumference of the wheel. The power is increased by enlarging the wheel or lengthening the arm of the crank, or by diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel and axle, called the *double axis machine* or differential windlass, in which the power can be increased with more safety. This is shown in fig. 3, where

Fig. 3.

b and c are two cylinders of different diameters, firmly fixed on the axle carrying the crank. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the large cylinder in a contrary direction. When in motion every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes; and the power is therefore to the weight as this half difference is to the circumference of the power, or the circle described by the crank. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if b and c come to be of equal thickness, the weight would not rise at all, the rope, in that case, wound upon b being only equal to that unwound from c. (See under DIFFERENTIAL.) The wheel and axle is sometimes called the *perpetual lever*, in consequence of the power being continued by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill are so many applications of the wheel and axle. — *Wheels within wheels*, a complication of circumstances, motives, influences, or the like.

It was notorious that after this secretary retired the king's affairs went backwards; *wheels within wheels* took place. *Roger North.*

This will explain a smart repartee of Sir Francis Bacon's before King James, to whom Sir Kenelm Digby was relating that he had seen the true philosopher's stone in the possession of a hermit in Italy, and when the king was very curious to understand what sort of stone it was, and Sir Kenelm much puzzled in describing it, Sir Fra. These birds are commonly called *widow-birds*, but whether this be merely a translation of their Latin generic name *Vidua*, which may have been given from the sombre hue of the plumage, or whether it be a corruption of Whidah, is uncertain.

Whig (whig), *n.* [If the historical account below is correct, the origin would seem to be the Sc. word *whig*, to jog along briskly, the connections of this being doubtful.] 1. A designation given to the members of one of the great political parties in Britain. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Burnet it is derived from *whiggam*, a word which was used by the peasants of the southwest of Scotland in driving their horses. He tells us that people from this quarter used often to come to Leith with their horses for corn, and from this peculiar word were called *whiggamores*, contracted to *whigs*. In 1648, after the news of the Duke of Hamilton's defeat, the clergy of the west of Scotland stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishioners. The Marquis of Argyll and his party came and headed them. This was called the *whiggamores' inroad*, and ever after that all that opposed the court came, in contempt, to be called *whiggs*. From Scotland the word was brought to England, where it has since continued to be used as the distinguishing appellation of the political party opposed to the *Tories*. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of England. Generally speaking, the principles of the Whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. The term *Liberals* is now generally applied to the representatives of this party; while the extreme section of the party may be said to have dropped all connection with the Whigs, and have adopted the name of Radicals. See **TORY**.—2. In *American hist.* (a) a friend and supporter of the principles of the revolution; opposed to *Tory* and *Royalist*. There are two chief varieties of whisky—viz. malt-whisky and grain-whisky. The former variety is of finer quality, and made chiefly from malted barley or bere, and sometimes, though rarely, from rye. The latter is made from various substances, as sugar, molasses, potatoes, but principally from unmalted grain, as Indian corn, barley, oats, &c., dried and ground up. The grain most largely used is Indian corn. Grain-whisky requires the same process of fermentation and distillation as malt-whisky, but is cheaper, from its greater yield, and because it saves the expensive process of malting. Though coarser it is stronger, but if kept long enough is equally good.

—*Whispering gallery or dome*, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of *whispering galleries* and *domes* in general.

Whist! (whist), *v. i.* To become silent. *Surrey*.

Whist (whist), *n.* A well-known game at cards, said to be so called because the parties playing it have to be *whist* or silent, but this is doubtful. Another name was *whisk*. The game is played with the full pack of fifty-two cards by four persons, two being partners against the other two, each player receiving thirteen cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has laid the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honours, and count one each for the side who holds them; if one side hold three honours, they count two by honours, as the opposite side can have but one; if one side hold all the honours, four by honours is counted; should the honours be equally divided neither side counts, the honours being then said to cancel each other. In *long whist*, an obsolete form of the game, ten of these points made a game. In *short whist*, the game now

generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played.

Though that her jesses were my dear heart-strings
I'd *whistle* her off, and let her down the wind,
To prey at fortune. *Shak.*

—To *pay for one's whistle*, or to *pay dear for one's whistle*, to pay a high price for something one fancies; to pay dearly for indulging one's whim, caprice, fancy, or the like. Who (hō), *pron. relative*. [A Sax. *hwa*, who, mase, and fem., *whæt*, what, neut.; always an interrogative; genit. *hwæs*, dat. *hwæm*, instrumental *hwi*; Icel. *hver*, *heat*, Dan. *hvo*, *hva*, Sw. *hven*, who, whom, head, what; D. *wie*, *wat*, G. *wer*, *was*, Goth. *hwas*, *hwa*, *hwa*, *hwa*; cog. Lith. and O. Prus. *kas*, Rus. *ko*, *li*, *qui*, Gr. *kos*, *pos*, W. *pyu*, Gael. and Ir. *co*, Per. *ki*, Skr. *kas*—*who*. *Whose*, *whom*, are found as relatives about the end of the twelfth century; 'but *who* not until the fourteenth century, and was not in common use before the sixteenth century.' *Dr. Morris*. In genuine idiomatic Scotch *who* or *wha* (including also the possessive and objective) is still only an interrogative, that or 'at' being the relative. Akin are *when*, *where*, *whither*, *which*, &c.] A relative and interrogative pronoun always used substantively (that is, not joined with a noun), and with relation to a person or persons. It remains uninflected for number, but has the form *whom* for the objective and *whose* for the possessive. (*Whose* is also used for the possessive of *which* or that used as a rela-

tive.) (a) Used interrogatively *who* = *what* or *which* person or persons?

If 'ho hath woe? *who* hath sorrow? *who* hath contentions? Prov. xxiii. 29.

Whom have I in heaven but thee? Ps. lxxiii. 25.

In such a sentence as, I do not know *who* you are, *who* is the indirect or dependent interrogative. (b) Used relatively = *that*.

I sought him *whom* my soul loveth. Cant. iii. 1. Happy the man, and happy he alone. *Dryden*. He *who* can call to-day his own.

(c) Sometimes used elliptically for *he*, *they*, or *those*, *who* or *whom*.

Who talks much must talk in vain. Gay. Whom the gods love die young. Byron.

—As *who* should say, as one who should say; as if he should say.

He wisely look'd on me As *who* should say 'I would thou wert the man.' *Shak*.

—*Who*, *Which*, *That*. These agree in being relatives, *who* being used for persons, *which* for things, and *that* being used indifferently for either. *Who* and *which* have well-defined different uses: (a) they connect two co-ordinate sentences; as, I met a policeman *who* showed me the way; I studied geometry *which* I found useful. Each of these sentences could be turned into two propositions grammatically, as well as logically, independent: I met a policeman and he showed me the way; I studied geometry and it I found useful. Another use of the same nature is when the second clause is of the kind termed adverbial, where we may still resolve *who* and *which* into a personal or demonstrative pronoun and a conjunction; as, why should we condemn James *who* (for *he*, seeing that *he*) is innocent? why should we study phrenology *which* (seeing that *it*) is profless?

(b) They are often used to introduce subordinate or adjectival clauses, which serve to define or explain a noun regarding which a statement is made in the principal clause; as, I saw the man *who* first taught me to swim; the house *which* he built still stands. Now, in these latter uses, *who* and *which* cannot be turned into *and he*, and *it*. The following sentence, standing alone, is ambiguous: 'I re-read the book *which* gave me much pleasure.' This may mean either that the re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate sentences and belongs to section (a), or it may mean I re-read the book which when formerly read gave me much pleasure. In the latter case the second clause limits or explains the object of the first and belongs to section (b). To remove such ambiguity, and the unpleasant effect arising from the too frequent use of *who* and *which*, it has been proposed by some grammarians (especially Professor Bain) always to employ *that* and not *who* or *which*, when the relative is used to introduce a restrictive or adjectival clause, and instead of saying 'the man *who* hath no music in himself . . . is fit for treasons, &c.' 'they are the books . . . which nourish all the world,' to say, as Shakspeare says, 'the man that hath, &c.' 'they are the books . . . that nourish, &c.' reserving *who* and *which* for such cases as are noticed under section (a). See also *THAT*.

That faculty or power of the mind by which we determine either to do or not to do something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue; the power of producing acts of willing; the power of control which the mind possesses over its own operations.

Appetite is the *will's* solicitor, and the *will* is appetite's controller; which we covet according to the one, by the other we often reject. Hooker.

Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of *will*.

2. The act of willing; the act of determining choice or forming a purpose; volition.

It is necessary to form a distinct notion of what is meant by the word 'volition' in order to understand the import of the word 'will,' for this last word expresses the power of mind of which volition is the act. . . . The word 'will,' however, is not always used in this its proper signification, but is frequently substituted for 'volition,' as when I say my hand moves in obedience to my *will*. D. Stewart.

3. The determination or choice of one possessing authority; discretionary pleasure; behest; command; decree.

4. Strong wish or inclination; bent of mind; disposition.

He that complies against his *will*,

Is of the same opinion still. Hudibras.

Inclination is another word with which *will* is frequently confounded. Thus, when the apothecary says in *Romeo and Juliet*:

My poverty and not my will consents, &c., the word *will* is plainly used as synonymous with *inclination*, not in the strict logical sense, as the immediate antecedent of action. It is with the same latitude that the word is used in common conversation, when we speak of doing a thing which duty prescribes, against one's own *will*; or when we speak of doing a thing willingly or unwillingly.

7. In law, the legal declaration of a man's intentions as to what he wills to be performed after his death in relation to his property; a testament. In England no will, whether of real or personal estate, is to be valid unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction. Such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator. Soldiers on actual service, or mariners at sea, have the power of making *nuncupative wills*. In the United States the law is in substantial agreement with that of England. In Scotland formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's liferent in the subject was reserved, but heritable property can now be so disposed of.—*Good will*, (a) favour; kindness. (b) Right intention. Phil. i. 15.—*Ill will*, enmity; unfriendliness. It expresses less than *malice*. See GOOD-WILL and ILL-WILL.—*To have one's will*, to obtain what is desired.—*To work one's will*, to act absolutely according to one's own will, wish, pleasure, or fancy; to do entirely what one pleases with something.

Dickens.

Will (wil), *v. aux.*, pres. 1 *will*, thou *wilt*, he *will*; past *would*; no past participle. [A. Sax. *willan*, pres. sing. 1 and 3 *wile*, 2 *wilt*, pl. *willaht* (1, 2, and 3); pret. *wolde*, *woldest*; pl. *woldon* or *woldan*; D. *willen*, Icel. *vilja*, Dan. *villie*, to will; G. *will*, I will, he will, infin. *wollen*; Ger. *voljan*; cog. L. *volo*, I will, *velle*, to will; Gr. *boulomai*, I will. Akin *well*, *weal*, *wild*.] A word denoting either simple futurity or futurity combined with volition according to the subject of the verb. Thus, in the first person, I (we) *will*, the word denotes willingness, consent, intention, or promise; and when emphasized it indicates determination or fixed purpose; as, I *will* go, if you please; I *will* go at all hazards; I *will* have it in spite of him. In the second and third persons *will* expresses only a simple future or certainty, the idea of volition, purpose, or wish being lost; thus, 'you *will* go,' or 'he *will* go,' indicates a future event only. The second person may also be used as a polite command; as, you *will* be sure to do as I have told you.—As regards *will* in questions Mr. R. Grant White lays down the following rules: '*Will* is never to be used as a question with the first person; as, *will* I go? A man cannot ask if he wills to do anything that he must know and only he knows. . . . As a question, *will* in the second person asks the intention of the person addressed: as, *will* you go to-morrow? that is, Do you mean to go to-morrow? . . . As a question, *will* in the third person asks what is to be the future action of the person spoken of, with a necessary reference to intention; as, *will* he go? that is, Is he going? Does he mean to go and is his going sure?' Simple futurity with the first person is appropriately expressed by *shall*. (See SHALL.) Among inaccurate speakers and writers, especially in Scotland, Ireland,

and in some parts of the United States, there is some confusion in the use of *shall* and *will*; thus *will* improperly takes the place of *shall* in such frequently used phrases as, 'I *will* be obliged to you,' 'we *will* be at a loss,' 'I *will* be much gratified,' and so on. — *Would* stands in the same relation to *will* that *should* does to *shall*. Thus *would* is seldom or never a preterite indicative pure and simple, being mainly employed in subjunctive, conditional, or optative senses, in the latter case having often the functions and force of an independent verb; as, (a) conditional or subjunctive, 'he *would* do it if he could,' 'he could do it if he *would*,' 'they *would* have gone had they been permitted.' Here it will be seen *would* refers to the present only, the past being expressed by *would have*. In such sentences as 'He was mistaken it *would* seem,' or 'it *would* appear' — in which *should* is sometimes used — *would* retains almost nothing of conditionality, having merely the effect of softening a direct statement. (Mr. R. Grant White regards 'it *should* seem' as the normal expression, though he quotes 'it *would* appear' from good English writers. He himself writes, 'It *would* seem that a man of Mr. Lowe's general intelligence should know.' *Every-day English*, chap. xiii.) (b) Optative; 'I *would* that I were young again.' In this use the personal pronoun is often omitted. 'Would to God we had died in Egypt.' Ex. xvi. 3. 'Would God I had died for thee, O Absalom.' 2 Sam. xviii. 3. 'Would thou wert as I am.' *Shak.* — *Would* most nearly has the force of a simple past indicative in such sentences as, 'he *would* go and you see what has happened,' but this implies farther that he did actually go or at least set out, and the *would* is here emphatic. — *Would* is also used to express a habit or custom, as if it implied a habitual exercise of will; as, she *would* weep all day; every other day he *would* fly into a passion. — *Will* and *would* were formerly often used with adverbs and prepositional phrases to express motion or change of place, where modern usage would require *will* go, *would* go, or the like. 'Now I *will* away,' 'I'll to the ale-house,' 'I *will* about it,' 'I'll to my books,' 'he is very sick and *would* to bed,' 'there were wit in this head, an *would* out.' *Shak.* — What may be called a similar elliptical usage occurs in such phrases as 'what *would* you?' where present usage would supply *have* or *do*.

Willow (wil'ló), *n.* [A. Sax. *wetig*, *witig*, D. *wilg*, L.G. *wilge*, a willow; probably from root of *wallow*, L. *volvo*, to roll, from the flexibility of its twigs.] 1. The common name of different species of plants belonging to the genus *Salix*, the type of the natural order Salicaceae. The species of willows are numerous, about 160 having been described, many of which are British. They are all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere. They grow naturally in a moist soil, and wherever planted they should be within the reach of water. On account of the flexible nature of their shoots, and the toughness of their woody fibre, willows have always been used as materials for baskets, hoops, crates, &c. The wood is soft, and is used for wooden shoes, pegs, and the like; it is also much employed in the manufacture of charcoal, and the bark of them all contains the tanning principle. The Huntingdon or white willow (*Salix alba*) and the Bedford willow (*S. fuscescens*) are large trees, yielding a light soft timber, valuable for resisting the influence of moisture or damp. The weeping willow (*S. babylonica*) is a native of China, and is a fine ornamental tree. The willow has for long been considered assymbolical of mourn-

ing, grief, bereavement, forsakenness, or the like.

Tell him, in hope he'll prove a widower shortly,
I'll wear the *willow* garland for his sake. *Shak*

Knight.] In *woollen manuf.* a machine for opening and disentangling the locks of wool and cleansing them from sandy and other loose impurities.

Wind (wind, in poetry often *wind*), *n.* [A. Sax. D. and G. *wind*, Dan. and Sw. *vind*, Icel. *vindr*, Goth. *vinds*; cog. L. *ventus*, W. *gwynt*, wind. The root is in Goth. *vaián*, Skr. *vā*, to blow. *Weather* is from same root.] 1. Air naturally in motion with any degree of velocity; a current of air; a current in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze; when with more velocity, a fresh breeze; and when with violence, a gale, storm, tempest, or hurricane. The principal cause of these currents of air is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up, while colder air rushes in to supply its place, and thus produces wind. As

oil, pound; u, Sc. abune; y, Sc. ley.

the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported by these opposite currents is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed* or *constant*, as the trade-winds; *periodical*, as the monsoons; and *variable winds*, or such as blow at one time from one point, at another from another point, and at another time cease altogether. (See TRADE-WIND, MONSOON.) There are also various local winds, which receive particular names; as, the *Etesian wind*, the *Sirocco*, the *Simoon*, the *Harmattan*, the *Mistral*, *Typhoon*, &c. (See these terms.) The velocity and force of the wind vary considerably, as shown by the anemometer. Thus a light wind travelling at the rate of 5 miles an hour exercises a pressure of 2 oz. on the square foot; a light breeze of 10 miles an hour has a pressure of 8 oz.; a good steady breeze of 20 miles, 2 lbs.; a storm of 60 miles, 18 lbs.; a violent hurricane of 100 miles, 50 lbs., a pressure which sweeps everything before it. Winds are denominated from the point of compass from which they blow; as, a *north wind*, an *east wind*, a *south wind*, a *west wind*, a *south-west wind*, &c.

Except wind stands as it has never stood,
It is an ill wind that turns none to good. *Tusser.*

Air artificially put in motion from any force or action; as, the *wind* of a cannon-ball; the *wind* of a bellows. 'The whiff and *wind* of his fell sword.' *Shak.*—4. [Slang.] —*To be in the wind*, originally perhaps literally to be such as may be scented, hence to be in covert preparation; to be within the region of suspicion or surmise, without being acknowledged or announced; as, I strongly suspect there is something in the *wind* which will shortly astonish us. It is now, however, considered to be occasioned by the projectile itself striking the body in an oblique direction, the comparative escape of the external soft tissues being accounted for by the degree of obliquity with which the missile impinges on the elastic skin, together with the position of the internal structures injured relatively to the impingement of the ball on one side and hard resisting substances on another.

The name is, however, generally restricted to the orchestral instruments of the second class, consisting of a tube (straight, bent, or curved), producing a fundamental tone with its harmonics or overtones when the vibrating column extends the whole length of the tube. This column may, however, be shortened by having holes of certain sizes and at certain distances along the tube, which are opened or stopped by the fingers or valves, the instrument being thus adapted to produce in its simpler forms the tones of the diatonic scale, and in its more complex forms the tones of the chromatic scale. The wind-instruments of an ordinary orchestra are divided into two classes: wood instruments, as the flute, oboe, clarinet, and bassoon; and brass instruments, as the horn, cornet-a-pistons, trombone, euphonium, bombardon, and ophicleide. The quality of tone of the woods is soft, smooth, light, and almost vocal; that of the brasses is somewhat harder, more powerful and majestic. Being all fixed toned they cannot, of course, play in perfect tune like

stringed instruments, and they can only produce one sound at a time.

windlass used in ships, for raising the anchor or obtaining a purchase on other occasions, consists of a strong beam of wood placed horizontally, and supported at its ends by iron spindles, which turn in collars or bushes inserted in what are termed the *windlass bits*. This large axle is pierced with holes directed towards its centre, in which long levers or handspikes are inserted for turning it round when the anchor is to be weighed or any purchase is required. It is furnished with *pavels* to prevent it from turning backwards when the pressure on the handspikes is intermitted.—2.† A handle by which anything is turned; specifically, a winch-like contrivance for bending the arblast or cross-bow. Windmill (wind'mil), *n.* 1. A mill which receives its motion from the impulse of the wind, and which is used for grinding corn, pumping water, &c. The structure of a

Section of upper part of Windmill.

the wind is made to act upon sails or vanes, *AA* (generally four in number), attached by means of rectangular frames to the extremities of the principal axis or *wind-shaft* of the mill, which is placed nearly horizontal, so that the sails, by the action of the wind, revolve in a plane nearly vertical, giving a rotary motion to the driving-wheel *E* fixed to the wind-shaft, and thus conveying motion to the vertical shaft *F* and the machinery connected with it. The extremity of the wind-shaft must always be placed so as to point to the quarter from which the wind blows. To effect this some mills have a self-adjusting cap *B*, which is turned round by the force of the wind acting upon the fan or flyer *C*, attached to the projecting framework at the back of the cap. By means of a pinion on its axis, motion is given to the inclined shaft and to the wheel *D* on the vertical spindle of the pinion *a*, this latter pinion engages the cogs on the outside of the fixed rim of the cap; by these means the sails are kept constantly turned to the wind, the head of the mill moving slowly round the moment any change in the direction of the wind causes the fan *C* to revolve. In the *horizontal* windmill the wind-shaft is vertical, so that the sails revolve in a horizontal plane. The effect of horizontal windmills, however, is considered to be far inferior to that of the vertical kind. The effect of windmills depends greatly upon the form and position of the sails. See also **POST-MILL**.—2. A visionary scheme; a vain project; a fancy; a chimera.

Wine (win), *n.* [A. Sax. *win*, borrowed (like *D. wijn*, Icel. *vín*, Dan. *vín*, Goth. *wein* or *vein*, G. *wein*) from L. *vinum*, wine, which corresponds to Gr. *oinos*, with digamma *oinos* or *foinos*, wine, L. *vinum*, wine, is what is produced by *vitis*, the vine, the twining plant (cog. with E. *withy*), the root meaning to twine or twist, see *vitum*, in *vitium*, vice, and in E. *wind*, *vein*, &c.]

1. The fermented juice of the grape or fruit of the vine (*Vitis vinifera*. See *VITIS*). Wines are distinguished practically by their colour, hardness & softness on the palate, their flavour, and their being still or effervescing. The differences in the quality of wines depend partly upon differences in the vines, but more on the differences of the soils in which they are planted, in the exposure of the vineyards, in the treatment of the grapes, and the mode of manufacturing the wines. When the grapes are fully ripe, they generally yield the most perfect wine as to strength and flavour. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The amount of alcohol in the stronger ports and sherries is from 16 to 25 per cent; in hock, claret, and other light wines from 7 per cent. Wine containing more than 13 per cent of alcohol may be assumed to be fortified with brandy or other spirit. The most celebrated ancient wines were those of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans. The principal modern wines are Port, Sherry, Claret, Champagne, Madeira, Hock, Marsala, &c. &c. The varieties of wine produced are almost endless, and differ in every constituent according to the locality, season, and age; but generally the produce of each vineyard retains its own leading characteristics. The principal wine-producing countries are France, Germany, Spain, Portugal, Sicily, Greece, Cape Colony, Australia, and America.—2. 1. One of the anterior limbs in birds, corresponding to the arms in man, and in most cases serving as organs by which flight is effected, though in some birds they merely aid in running or swimming. Normally the wings consist of the bones of the fore-limbs, specially modified and provided with feathers. To that part of the limb analogous to the hand are attached the primaries or greater quill-feathers, the secondaries are affixed to the forearm, and the arm supports the tertiaries and scapulars. The bone which represents the thumb gives rise to the bastard quills, and along the base of the quills are ranged the wing-coverts. Wis (wis). Erroneously given in many dictionaries as a verb, with the pret. *wis*, and defined, to know, to be aware, to think, &c. But *wis* belongs to *wit*, to know (see **WIT**), and there never was a real verb *wis*, to know. The error seems to have arisen from the adverb *I-wis*, *i-wis* (certainly), being frequently written with the prefix apart from the rest of the word, and often with a capital letter so as to appear as *I-wis*, or *I wis*; hence the *I* was mistaken for the first personal pronoun, and the verb *wis* created. No doubt writers themselves (in later times at least) have often thought when they wrote 'I wis' they were using a verb, and have regarded it as equivalent to *I know*, *wen*, or *I imagine*.

It is often nearly synonymous with *discretion*, or with *prudence*, but both of these are strictly only particular phases of wisdom. The forms *wottest*, *wots*, *wotting*, &c., are comparatively modern forms. Cog. L. *video*, *visum*, to see (see *VISION*). Gr. *(v)idein*, to see, *(v)idenai*, to know, Skr. *vid*, to know, to perceive. Hence *wit*, the noun, *witness*. Akin are *wise*, *wizard*.] To know; to be or become aware; to learn: used with or without an object, the object being often a clause or statement. (a) Infinitive or gerund.

Wit (wit), *n.* [A. Sax. *wit*, *gewit*, knowledge, mind, understanding; Icel. *vit*, Dan. *vid*, G. *witz*, understanding, wit. See the verb.] 1. Intellect; understanding or mental powers collectively.

Your *wit* will not so soon out as another man's will; 'tis strongly wedged up in a block-head. *Shak.*

Will puts in practice what the *wit* deviseth; Will ever acts, and *wit* contemplates still. *Sir F. Davies.*

2. A faculty or power of the mind or intellect: generally used in the plural; as, he has all his *wits* about him.

But there are many who have a bad trick of minding the preacher carefully enough for a minute or two, and then letting their *wits* wander, and thinking about something else. *Kingsley.*

—The *five wits*, an old expression sometimes used for the five senses, but oftener defined: common wit, imagination, fantasy, estimation, memory.

If our *wits* run the wild-goose chase, I have done; for thou hast more of the wild-goose in one of thy *wits*, than I have in my whole *five*. *Shak.*

But my *five wits* nor my five senses can Dissuade one foolish heart from serving thee. *Shak.*

—At one's *wits' end*, at a loss what further steps or measures to adopt; having exhausted the last known plan or contrivance; unable to think further.

4. The power of invention; the inventive faculty; contrivance; ingenuity. 'Each several stone, with *wit* well blazon'd.'

Shak.

Ruskin.

5. † The power of original combination under the influence of the imagination; the imaginative faculty.

Wit in poetry . . . is no other than the faculty of imagination in the writer, which . . . searches over all the memory for the species or ideas of those things which it designs to represent.

Dryden.

6. The faculty of associating ideas in a new and ingenious, and at the same time natural and pleasing way exhibited in apt language; the felicitous combination of words and thoughts by which unexpected resemblances between things apparently unlike are vividly set before the mind so as to produce a shock of pleasant surprise; facetiousness.

Wit lies most in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions to the fancy.

Locke.

True *wit* consists in the resemblance of ideas. . . . But every resemblance of ideas is not what we call *wit*, and it must be such an one that gives delight and surprise to the reader. Where the likeness is obvious, it creates no surprise, and is not *wit*. Thus, when a poet tells us that the bottom of his mistress is as white as snow, there is no *wit* in the comparison; but when he adds, with a sigh, it is as cold too, it then grows into *wit*.

Dryden.

True *wit* is nature to advantage dress.

Pope.

What oft was thought, but ne'er so well express'd.

(The two extracts following bear on the distinction between *wit* and *humour*.)

Dr. Trusler says that *wit* relates to the matter, *humour* to the manner; that our old comedies abounded with *wit*, and our old actors with *humour*; that *humour* always excites laughter but *wit* does not; that a fellow of *humour* will set a whole company in a roar, but that there is a smartness in *wit*, which cuts while it pleases. *Wit*, he adds, always implies sense and abilities, while *humour* does not; that *humour* is chiefly felt by the vulgar, but education is requisite to comprehend *wit*.

Fleming.

It is no uncommon thing to hear 'He has *humour* rather than *wit*.' Here the expression commonly means pleasantry; for whoever has *humour* has *wit*, although it does not follow that whoever has *wit* has *humour*. *Humour* is *wit* appertaining to character, and indulges in breadth of drollery rather than in play and brilliancy of point. *Wit* vibrates and spurs; *humour* springs up exuberantly as from a fountain and runs on. In Congreve you wonder what he will say next; in Addison you repose on what is said, listening with assured expectation of something congenial to the pertinent. The French have little *humour*, because they have little character; they excel all nations in *wit* because of their levity and sharpness.

Lander.

7. One having genius, fancy, or humour; in modern usage, one who excels in the faculty defined in last definition; one distinguished for bright or amusing sayings; a humorist.

Indeed it was fully believed that they gave themselves up to him, body and soul, while he engaged that they should want for nothing, and he able to assume whatever shape they pleased, to visit and torment their enemies, and accomplish their infernal purposes. As soon as the bargain was concluded, the devil was said to deliver to the witch an inup or familiar spirit, to be ready at call, and to do whatever it was directed. By the aid of this imp and the devil together, the witch, who was almost always an old woman, was enabled to transport herself through the air on a broomstick, and to transform herself into various shapes, particularly those of cats and hares; to inflict diseases on whomsoever she pleased, and to punish her enemies in a variety of ways. The belief in witchcraft is very ancient. It was a common belief in Europe till the sixteenth century, and maintained its ground with tolerable firmness till the middle of the seventeenth century; indeed it is not altogether extinct even at the present day. Numbers of reputed witches were condemned to be burned, so that in England alone it is computed that no fewer than 30,000 of them suffered at the stake. —2. The A. Sax. *with*, opposite, contrary to, against (see in *withers*), is a comparative from this; like Icel. *viðr*, D. *veeder*, G. *wieder*. Bulg. *wluku*, Lith. *wilkas*, L. *lupus*, Gr. *lukos* (both with loss of the initial *l*), Skr. *wrika*—wolf; all traced to a root *wark*, *walk*, meaning to tear.] 1. A quadruped belonging to the digitigrade carnivora, family Canidae, in habits and physical development closely related to the dog, some naturalists, indeed, considering it as the progenitor of some existing races of the dog, with which it has been known to interbreed. The common European wolf (*Canis lupus*) is yellowish or fulvous gray; the hair is harsh and strong, the ears erect and pointed, the tail straight, or nearly so, and there is a blackish band or streak on the forelegs about the carpus. The height at

the shoulder is from 27 to 29 inches. The wolf is swift of foot, crafty, and rapacious; a destructive enemy to the sheep-cote and farm-yard; it associates in packs to hunt the larger quadrupeds, such as the deer, the elk, &c. When hard pressed with hunger these packs have been known to attack isolated travellers, and even to enter villages and carry off children. In general, however, wolves are cowardly and stealthy, approaching the sheepfolds and farm-steading only at dead of night, making a rapid retreat if in the least scared by a dog or a man, and exhibiting great cunning in the avoidance of traps. Wolves are still plentiful in some parts of Europe, as France, Spain, Italy, Germany, Turkey, and Russia; they probably ceased to exist in England about the end of the fifteenth century; the last of their race in Scotland is said to have been killed by Cameron of Lochiel in 1680, while in Ireland they are known to have existed until at least the beginning of the eighteenth century. The black wolf (*C. occidentalis*) of America is a larger and finer animal than his European congener. The little prairie-wolf or coyote (*C. ochropus*), abounding on the vast plains of Missouri and Mexico, is a burrowing animal, and resembles in many respects the jackal. The

Common Wolf (*Canis lupus*).

See TEMPERAMENT. (b) Some particular tone often produced on a violin, violoncello, or other stringed instrument the intonation of which is not true, even when the stopping is normally correct.—To see a wolf, to lose one's voice. Our forefathers, adopting the belief of the ancients (see Virgil, *eccl. ix.*), supposed that if a man saw a wolf before the wolf saw him he lost his voice, at least for a time.

'Our young companion has seen a wolf,' said Lady Hameline, 'and has lost his tongue in consequence.' *Sir W. Scott.*

Lith. and Lett. *wilna*, Rus. *wolna*, Skr. *urnā*, *urā*. Allied to L. *villus*, shaggy hair, *rellus*, a fleece, Gr. *perion*, wool; traced to a root signifying to cover, to protect, and supposed to be seen also in L. *vallis*, a valley, and in *rato*, to be strong. See **VALID**.] 1. That soft species of hair which grows on sheep and some other animals, as the alpaca, some species of goats, &c., which in fineness sometimes approaches to fur. The word generally signifies the fleecy coat of the sheep, which constitutes a most essential material of clothing in all cold and temperate climates. Wool is divided into two classes—*short or carding wool*, seldom reaching over a length of 3 or 4 inches, and *long or combing wool*, varying in length from 4 to 8 inches, each class being subdivided into a variety of sorts, according to their fineness and soundness of the staple. The finest wools are of short staple, and the coarser wools usually of long staple. Wools which unite a high degree of fineness and softness, with considerable length of staple, bear a high price. English-bred sheep produce a good, strong, combing wool, that of the Scotch breeds being somewhat harsher and coarser. The finest carding wools were formerly exclusively obtained from Spain, the native country of the merino sheep, and at a later period extensively from Germany, where that breed had been successfully introduced and cultivated. Immense flocks of merinos are now reared in Australia, South America, and South Africa, and from these quarters Britain now obtains her chief supply.—2. Under the old poor-laws of England, there was a work-house in each parish, partaking of the character of a bridewell, where indigent, vagrant, and idle people were set to work, and supplied with food and clothing, or what is termed *indoor relief*. Some were used as places of confinement for rogues and vagabonds, who were there confined and compelled to labour; whilst others were large almshouses for the maintenance and support of the indigent. Previous to the passing of the Poor-law Amendment Act in 1834, these workhouses were described as, generally speaking, nurseries of illness, ignorance, and vice. By the act alluded to parishes were united for the better management of workhouses, which gave rise to the poor-law unions with their workhouses, capable of containing from 100 to 500 inmates. In these establishments a suitable classification of the pauper inmates has been effected, and proper government and discipline instituted. The paupers of the several classes are kept employed according to their capacity and ability. Religious and secular instruction is supplied, habits of industry, cleanliness, and order are enforced; and wholesome food and sufficient clothing are furnished.

But 'worship' or 'worshipful' meant 'honour' in our early English, and 'to worship' to honour, this meaning of *worship* still very harmlessly surviving in the title of 'your worship,' addressed to the magistrate on the bench. So little was it restricted of old to the honour which man is bound to pay to God, that it was employed by Wiclif to express the honour which God will render to his faithful servants and friends. X.

X, the twenty-fourth letter of the English alphabet, was borrowed by the Romans in comparatively late times from the Greeks, and passed from the Roman into the Anglo-Saxon alphabet. The Greek *X*, however, was a guttural, probably like the Scotch or German *ch*, and why in Latin it should have assumed the functions of the Greek character χ (= *x*) is not very clear. Except when used at the beginning of a word, *x* in English

is a double consonant (as it was in Latin and Greek), and has usually the sound of *ks*, as in *vax*, *lax*, *axis*, &c.; but when terminating a syllable, especially an initial syllable, if the syllable following it is open or accented, it often takes the sound of *gz*, as in *luxury*, *exhaust*, *exalt*, *exotic*, &c. At the beginning of a word it has precisely the sound of *z*. Hence it is entirely a superfluous letter, representing no sound that could

not easily be otherwise represented. As an initial it occurs in a few words borrowed from the Greek, never standing in this position in words that are properly English in origin.—As a numeral *X* stands for ten. It represents one V, which stands for five, placed above another, the lower one being inverted. When laid horizontally, thus \times , it stands for a thousand, and with a dash over it, thus \bar{X} , it stands for ten thousand.

Y.

Y, the twenty-fifth letter of the English alphabet, was taken from the Latin, the Latin having borrowed it from the Greek *Υ* or *upsilon*. In the Anglo-Saxon alphabet it was always a vowel, and is believed to have had a sound resembling that of French *u* or German *ü*, this being, also the sound which the Greek *Υ* is believed to have had. In modern English it is both a consonant and a vowel, and seldom or never is the historical representative of A. Sax. *y*, this being usually represented by *i*. At the beginning of syllables and followed by a vowel it is a consonant of the palatal class, being formed by bringing the middle of the tongue in contact with the palate, and nearly in the position to which the *g* hard brings it. Hence it has happened that in a great number of words *g* has been softened into *y*, as A. Sax. *gear* into *year*, *geornian* into *yearn*, *dag* into *day*. As an adjective termination it commonly represents A. Sax. *-ig*, as in *stony* = A. Sax. *stainig*, *greedy* = A. Sax. *grædig*, *hungry* = A. Sax. *hungrig*, *many* = A. Sax. *mænig*. In some nouns it also represents the term *-ig*, as in *honey* = A. Sax. *honeyig*, *reithy* = A. Sax. *reithig*. In the term *-ly* it stands for *ie* or *ice*, as in *godly* = A. Sax. *godlic*, *friendly* = A. Sax. *freondlic*, *fully* = A. Sax. *fullice*, *hardly* = A. Sax. *heardlice*, &c. In words of Romance origin the term *-y* often represents Fr. *-ie*, L. *-ia*, as in *history*, *modesty*, *memory*, *victory*; it also represents

L. *-ium*, the noun termination, as in *study*, *remedy*, *subsidy*, &c., or the adjective termination, as in *notary*, *contrary*, *secondary*, &c. In nouns ending in *-ly* the *-ty* represents Fr. *-té*, L. *-tas*, *-tatis*, as in *vanity*, *calamity*, &c. In the middle and at the end of words *y* is a vowel, and is precisely the same as *i*. It is sounded as *i* long, when accented, as in *defy*, *rely*, *dying*; and as *i* short when unaccented, as in *vanity*, *glory*, *synonymous*. As a consonant this letter bears much the same relation to *i* (short) as *w* does to *u*; thus *i* short has in certain positions—as in the *ia* of *Christian*—a tendency to pass into *y*. *Y* is sometimes called the Pythagorean letter, from its Greek original representing, by means of its three limbs, the sacred triad, formed by the dual proceeding from the monad.—In *chem.* *Y* is the symbol of yttrium.—*Y*, as a numeral, stands for 150, and with a dash over it, *Ȳ*, for 150,000.

Y-, A common prefix in Old English words, as in *y-clept*, *y-clad*, &c., representing A. Sax. *ge-*, which assumed this form by the common weakening of *g* to *y*. The meaning of words with this prefix is usually the same as if it were absent. See *GE*.

There are two distinct species of yacht: the mere racer with enormous spars and sails and deeply-ballasted hull, with fine lines, but sacrificing everything to speed; and the elegant, commodious, well-proportioned travelling yacht, often with steam-propelling machinery, fit for a voyage round the world. The yacht navy of Britain comprehends vessels from 3 to about 600 tons.

There are several varieties of the yak due to climatic influences, character of habitat, food, and, in the case of domesticated animals, to the kind of work to which they are put, as the *noble yak*, the *ghain-orik*, the *plough-yak*. The last is a plebeian-looking animal, and wants the magnificent side tufts of hair characteristic of its free brethren. It is employed in agriculture. The yak is often crossed with other domestic cattle, and a mixed breed obtained. The tail of the yak is in great request for various ornamental purposes, and forms quite an important article of commerce. Dyed red it decorates the caps of the Chinese, and when properly mounted it is used as a fly-flapper in India under the name of a chowry.

Yankee (yánk'ké), *n.* [A word of uncertain origin. The most common explanation seems also the most plausible, namely, that it is a corrupt pronunciation of *English* or of Fr. *Anglais* formerly current among the American Indians. In Bartlett's *Dictionary of Americanisms* a statement is quoted to the effect that *Yengees* or *Yenkees* was a name originally given by the Massachusetts Indians to the English colonists, and that it was afterwards adopted by the Dutch on the Hudson, who applied the term in contempt to all the people of New England. Bartlett also quotes a statement of Heckwelder (an authority on Indian matters), who affirmed that the Indians applied the term *Yengees* specially to the New Englanders as contradistinguished from the Virginians or Long Knives, and the English proper or Saggenash. As early as 1713 it is said to have been a common cant word at Cambridge, Mass., in the sense of good or excellent, being probably borrowed by the students from the Indians, to whom a 'Yankee' article would be synonymous with an excellent one, from the superiority of the white man in mechanical arts.] A cant name for a citizen of New England. During the American Revolution the name was applied to all the insurgents; and during the civil war it was the common designation of the Federal soldiers by the Confederates. In Britain the term is sometimes applied generally to all natives of the United States.

Yankee-Doodle (yánk-ké-dó'dl), *n.* 1. A famous air, now regarded as American and national. It is said that the brigade under Lord Percy, after the battle of Lexington, marched out of Boston playing this tune in derisive and punning allusion to the name Yankee, and the New Englanders adopted the air in consideration of the fact that they had made the British dance to it. Ydrad† (i-drad), *pp.* Dreaded.

Ye (yē), *pron.* [A. Sax. *gē*, *ye*, nom. pl. corresponding to *thū*, thou; the genit. was *eowēr*, the dat. and acc. *eow*; so that *ye* is properly the nom. plural and *you* the obj.; D. *gi*, Icel. *er*, *er*, Dan. and Sw. *i*, G. *ih*, Goth. *ja*, all *ye* or *you* (pl.) See *YOU*.] Properly the nominative plural of the second person, of which *thou* is the singular, but in later times also used as an objective after verbs and prepositions. *Ye* is now used only in the sacred and solemn style; in common discourse and writing *you* is exclusively used.

But ye are washed, but ye are sanctified, 1 Cor. vi. 11.

Loving offenders thus I will excuse ye. *Shak.*

I thank ye; and be blest for your good comfort. *Shak.*

A south-west blow on ye And bluster you all o'er. *Shak.*

The confusion between *ye* and *you* did not exist in Old English. *Ye* was always used as a nominative, and *you* as a dative or accusative. In the English Bible the distinction is very carefully observed; but in the dramatists of the Elizabethan period there is a very loose use of the two forms. *Dr. Morris*.

Ye, † *adv.* *Yea*; yes. *Chaucer*.

Yea (yā), *adv.* [A. Sax. *gē*, *yea*, indeed; Icel. *jā*, D. *Ja*, Sw. and G. *ja*, Goth. *ja*, *jai*; allied to Goth. *jah*, and L. *jam*, now; Skr. *ya*, who.] 1. Yes; ay; a word that expresses affirmation or assent: the opposite of *no*; as, will you go? *yea*. 'Whilst one says only *yea*, and t'other *nay*.' *Denham*.

Let your communication be *yea*, *yea*; *nay*, *nay*. *Mat. v. 37*.

2. It sometimes introduces a subject with the sense of indeed, verily, truly, it is so, or is it so?

'Ye, hath God said, Ye shall not eat of every tree in the garden?' *Gen. iii. 1*.

Yea, mistress, are you so peremptory? *Shak.*

3. Used in the same way as *nay*, intimating that something is to be added by way of intensiveness or amplification; not this alone; not only so but also.

I therein do rejoice; *yea*, and will rejoice. *Phil. i. 18*.

One that composed your beauties, *yea*, and one To whom you are but as a form in wax. *Shak.*

4. Used substantively: (a) in *Script.* denoting certainty, consistency, harmony, and stability.

All the promises of God in him are *yea*, and in him are amen. *2 Cor. i. 20*.

(b) An affirmative vote; one who votes in the affirmative; the equivalent to *Ay* or *Aye*.—*Yea* is now used only in the sacred and solemn style. *Yea* like *nay* was formerly

used only in answer to questions framed affirmatively in contradistinction to *yes* and *no*, which were the proper answers to questions put negatively. See *EXTRACT*.

There is an example of the rejection of a needless subtlety in the case of our affirmative particles, *yes* and *yea*, *may* and *no*, which were formerly distinguished in use, as the two affirmatives still are in our sister-tongues, the Danish and Swedish. The distinction was that *yea* and *may* were answers to questions framed in the affirmative; as, Will he go? *Yea* or *May*. But if the question was framed in the negative, Will he not go? the answer was *Yes* or *No*.

Yead, † Yede† (yéd), *v. i.* [A false present tense and infinitive formed from the old preterite *yode, eode*. See *YODE*.] To go; to proceed.

This period comprehends what are called the twelve calendar months, and is usually calculated to commence on 1st January and to end on 31st December. It is not quite uniform, but its mean length is about 365 days, 5 hours, 48 minutes, and 51.6 seconds. The return of the seasons depends upon it. In popular usage, however, the year consists of 365 days, and every fourth year of 366. See *BISSEXTILE*, *LEAP-YEAR*.—*Anomalistic year*. See under *ANOMALISTIC*.—*Civil year*, the tropical or solar year.—*Common year*, a year of 365 days, as distinguished from *leap-year*.—*Ecclesiastical year*, from Advent to Advent.—*Gregorian year*, *Julian year*. Skeat regards the word in *yearning* 2 (the only meaning found in Shakespeare) as quite different, taking it from O. E. *erne*, to grieve, from A. Sax. *yernan*, to grieve, to vex, from *earn*, poor, wretched (D. Dan. *Sw* and G. *arn*, Icel. *arnr*, Goth. *arns*). If this is correct the word has evidently been influenced in its form by confusion with *yearn*, to desire.] 1. Yeast (yést), *n.* [O. E. *yeest*, A. Sax. *giest*, *giest*, Icel. *jást*, *jastr*, D. *gest*, *giest*, M. H. G. *gest*, *giest*, Mod. G. *gäst*, yeast from a verb signifying to ferment seen in O. H. G. *gesan*, *jeaan*, Mod. G. *nähren*, *gischen*, *Sw* *gasa*, to ferment, to froth. Allied to Gr. *zein*, to boil, *zeleis*, E. *zeal*.] 1. Barm; ferment; the yellowish substance, having an acid reaction, produced during the vinous fermentation of saccharine fluids, rising partly to the surface in the form of a frothy, flocculent, viscid matter (*surface yeast*), and partly falling to the bottom (*sediment yeast*). Yeast consists of aggregations of minute cells, each cell constituting a plant, *Torula cerevisia*. The yeast-plant is a fungus, or rather a particular state of fungus, for there are many moulds which, under certain conditions, acquire the *torula* property, that is, become capable of decomposing sugar. The cell consists of a cyst composed of cellulose, inclosing a semi-fluid matter, essentially identical with protein. When a surface yeast-cell has attained full size, it gives off a little bud, which, on attaining the size of

the first, gives out another bud, and in this way the cells undergo exceedingly rapid multiplication. The germs of the yeast-plant are supposed to exist in countless multitudes in the atmosphere, from the fact that a saccharine solution which presents no surface to the atmosphere does not ferment, while on its being so exposed fermentation sets in. Fermentation takes place sooner and goes on more rapidly when yeast is added than when the fluid is merely exposed to the atmosphere, beer yeast possessing the property of setting up fermentation in the highest degree. Surface yeast is formed at 65° to 77° Fahr., and its action is rapid and irregular, whereas sediment yeast is formed at 32° to 45°, and its action is slow and quiet. Sediment yeast is reproduced by spores and not by buds. In their chemical relations the two do not appear to differ. Yeast varies in quality according to the nature of the liquid in which it is generated, and yeast merchants distinguish several varieties, which are employed for different purposes according to their energy and activity. Yeast is not only essential to the production of wine from grape juice and other fruit juices, the manufacture of beer, and the preparation of distilled spirits, but it is also the agent in producing the panary fermentation whereby bread is rendered light, porous, and spongy. Beer yeast is employed medicinally as a stimulant in low fevers, and is of great service in cases where, from inflammatory symptoms, wine is inadmissible.—*German yeast*, common yeast collected, drained, and pressed till nearly dry. It can be so kept for several months, and is much used by bakers.—*Patent yeast*, yeast collected from a wort of malt and hop, and treated similarly to German yeast.—*Artificial yeast*, a dough of flour and a small quantity of common yeast made into small cakes and dried. Kept free from moisture, it long retains its fermentative property.—2. Spume or foam of water; froth.

It is a low tree, usually rising 3 or 4 feet from the ground, and then sending out numerous spreading branches, forming a dense head of foliage often 30 to 40 feet high. On account of its gloomy and funeral aspect it was very frequently planted in churchyards, and is thus associated by our poets with death, the grave, bereavement, gloom, and the like. Its wood was extensively used in the manufacture of bows previous to the discovery of gunpowder, and the name has by several writers been used as synonymous with *bow*, much in the same way as *steel* for *sword*. 'With his yew add ready quiver.' *Sylvester.*

At first the brandished arm the javelin threw,
Or sent winged arrows from the twanging yew. *Gay.*

In our own days, on account of the durability of the timber, and of its hard, compact, close grain, it is much employed by cabinet-makers and turners. The American yew (*T. baccata canadensis*) is a low prostrate shrub, never forming an erect trunk. It is found in Canada and the more northern of the United States, and is commonly called *Ground-henlock*.

Z.

Z, the last letter of the English alphabet, is a sibilant consonant, and is merely a vocal or sonant *s*, having precisely the same sound that *s* has in *wise*, *ease*, *please*, &c. (See *S*.) It did not have a place in the Anglo-Saxon alphabet, though no doubt *s* had sometimes this sound. In old English of the fourteenth century it was common, and in some writings was often used where we now have *s*. The words in modern English which begin with *z* are all derived from other languages, mostly from the Greek. The case was the same in Latin, in which this letter was never really naturalized. When not initial, however, the case is different, and we often find it representing an older *s* in genuine English words, as in *blaze*, *freeze*, *gaze*, *graze*, *guzzle*, *hazard*, *size*, &c. As a final it occurs in some onomatopoeic words, as in *buzz*, *whizz*. In German *z* is very common, being

a double consonant, with the sound *ts*. In Greek it was also a double consonant=*ds* or *sd*. In Britain its name is *zed*, in America *zed* and *zee*.

They consist of trees with a cylindrical trunk, increasing by the development of a single terminal bud, and covered by the scaly bases of the leaves. The stems of all the zamias abound in a mucilaginous juice, which has a nauseous odour and an unpleasant taste, arising from the existence in it of a peculiar proximate principle. This may be removed by boiling, roasting, &c., when some of them form a nutritious article of food. *Caffer-bread* is a common name for the genus in South Africa, where the central part of the stem pith of *Z. cycadis*, after being prepared in a particular way, is formed into cakes, baked, and eaten by the natives. southern Africa, nearly as large as a horse, white, striped with numerous brownish-black bands on the head, trunk, and legs, except on the belly and inside of the thighs.

Zebra (*Equus zebra*).

The zebras graze in herds on the steep hill-side, and seek the wildest and most sequestered spots, so that they are extremely difficult of approach, not only from their watchful habits and great swiftness of foot, but also from the inaccessible nature of their abodes. The zebra is one of the handsomest, and also one of the wildest and least tractable of animals. Only in a few instances has it been domesticated, for it always retains its vicious, obstinate, and fickle nature. The name zebra is sometimes applied to the quagga and the dauw or Burchell's zebra; but they differ from the zebra in having no stripes on the lower limbs, while those on the body are not so black as the true zebra. The zebra is said to be becoming nearly extinct. See DAUW, QUAGGA.

Zinc (zingk), *n.* [Fr. *zinc*, G. *Sw.* and Dan. *zink*; allied to *G. zinn*, tin.] *Sym. Zn.* At. wt. 65. A metal frequently called *spelter* in commerce. It has a strong metallic lustre and a bluish-white colour. Its texture is lamellated and crystalline, and its specific gravity about 7. It is a hard metal, being acted on by the file with difficulty, and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300° F. it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773° F., and when slowly cooled crystallizes in four- or six-sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels it absorbs oxygen and forms the

white oxide called *flowers of zinc*. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance. It does not occur in the native state, but is obtained from its ores, which are chiefly the sulphide, or *zinc-blende*, and the carbonate or *calamine*. The oxide of zinc (ZnO) is a fine white powder insoluble in water, but very soluble in acids, which it neutralizes, being a very powerful base, of the same class as magnesia. It combines also with some of the alkalis. Zinc forms a series of compounds with organic radicals, such as zinc methyl, $Zn(CH_3)_2$, and zinc ethyl, $Zn(C_2H_5)_2$. Several of the salts of zinc are employed in medicine, as the sulphate or *white vitriol* ($ZnSO_4$), the chloride or *butter of zinc* ($ZnCl_2$), the acetate and the cyanide. Sheet-zinc is largely employed for lining water cisterns, baths, &c., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, &c.; they are also employed in the production of pictures, &c., in the style of woodcuts. (See ZINCOGRAPHY.) Zinc is much employed in the manufacture of brass and other alloys, and in preparing galvanized iron. See GALVANIZED.

When pure it is a white powder. It forms salts with acids.—*Zirconia light*, an intensely brilliant light, differing from the oxyhydrogen or lime light only in that it is produced from zircon oxides acted on by oxygen and a highly carburetted gas, in place of the less durable lime balls of the other process.

It is commonly obtained in the form of a black powder, but it is also known in the crystalline state, forming blackish-gray highly lustrous laminae, having a specific gravity of 4.15. Zirconium forms a chloride $ZrCl_4$, and an oxide ZrO_2 , commonly known as zirconia. It exists in a few rare minerals, notably in zircon or hyacinth, which is a silicate of zirconium. It appears to form a link between aluminium and silicon.

Five of the strings are stretched over a fretted keyboard, and are

used for playing the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb armed with a metal ring, striking the strings. These strings, which are tuned in fifths, have a chromatic range from C in the second space of the bass staff to D on the sixth ledger-line above the treble. All the remaining strings, called the accompanying strings, are struck by the first three fingers of the right hand, and being unstopped produce only the single tone to which they are tuned. The instrument while being played rests on a table with the keyboard side nearest the performer. Tyrol seems to be the native country of this instrument.

An imaginary belt or zone in the heavens, extending about 8° on each side of the ecliptic. It is divided into twelve equal parts called signs. (See SIGN.) It was marked out by the ancients as distinct from the rest of the heavens because the apparent places of the sun, moon, and the planets known to them were always within it. This, however, is not true of all the newly discovered planets.—2. A girdle; a belt; a zone. [Rare and poetical.]

It appears with greatest brilliance within the tropics, where it sometimes rivals the Milky Way. Its nature is unknown, the most plausible hypothesis, supported by many of our most eminent modern astronomers, being that it is the glow from a cloud of meteors revolving round the sun.

Zoea (zō'ē-a), *n.* The name given by Bosc to the larvæ of decapod crustaceans, under the impression that they were adults constituting a distinct genus. The mistake was due to the fact that the young decapod leaves the egg in a form very different from that of the full-grown animal, this stage of the animal's existence being now known as the *zoea-stage*.

Zoetrope (zō'ē-trōp), *n.* [Gr. *zōē*, life, and *trōpē*, a turning, from *trepō*, to turn.] A toy for children, consisting of an optical instrument, which exhibits pictures as if alive and in action, depending like the thaumatrope on the persistence of vision. It consists of a cylinder, open at the top, with a series of slits in its circumference, through which a person applying his eye to them can see the interior. A series of pictures representing the different attitudes successively assumed by an object in performing any act from its beginning to its close, as by a horseman in leaping a gate, an acrobat performing a somersault, and the like, is arranged along the interior circumference. The instrument is then set in rapid motion, and the person looking through sees the horseman, &c., as if endowed with life and activity, performing the act proper to his character.

In *nat. hist.* any well-defined belt within which certain forms of plant or animal life are confined; as the different belts of vegetation which occur in mountains and the like; specifically, one of the five belts or regions into which naturalists divided the sea-bottom in accordance with the depth of water covering each, this being supposed to determine its fauna and flora. They were called respectively *littoral*, *circumlittoral*, *median*, *inframedian*, and *abyssal*. Zoology (zô-o-lô-jî), *n.* [From Gr. *zôon*, an animal, and *logos*, discourse.] That science which treats of the natural history of animals, or their structure, physiology, classification, habits, and distribution. The term 'natural history' has been frequently used as synonymous with zoology, but such a term is obviously of wider significance, and should be used to indicate the whole group of the natural sciences. Zoology is a branch of biological science, constituting, in fact, with its neighbour branch botany, the science of biology. Its study comprehends such branches as the *morphology* of ani-

mals, or the science of form or structure, which again includes *comparative anatomy*, by which we investigate external and internal appearances, the positions and relations of organs and parts; the *development* of animals, which treats of the various stages leading from the embryonic to the mature state; the *physiology* of animals, which includes the study of the functions of nutrition, reproduction, and of the nervous system; *classification* or *taxonomy*, which assigns to the various individuals their proper place in the scale of life. A new department has been added in recent times, sometimes called *etiology*, which investigates the origin and descent of animals, or treats of the evolutionary aspects of zoological science. Various systems of classification have been framed by zoologists. Linnaeus divided the animal kingdom into six classes, viz. *Mammalia*, *Birds*, *Fishes*, *Amphibia*, *Insects*, and *Worms* (Vermes). Cuvier proposed a more scientific arrangement. He divided the animal kingdom into four sub-kingdoms, viz. *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*. Recent classifications are more strictly based on morphological characters. Professor Huxley recognizes the following sub-kingdoms: *Vertebrata*, *Mollusca*, *Molluscoida*, *Celenterata*, *Annulosa*, *Anneloida*, *Infusoria*, and *Protozoa*. See these terms.

Owing to their parts being more or less distinctly arranged round an axis he gave them the alternate name of *Radiata*. The term *zoophyte* is no longer employed by scientific naturalists. It is now loosely applied to many plant-like animals, as

sponges, corals, sea-anemones, sea-mats, and the like, the term *zoophytes* being synonymous with *Phytozoa*. See *PHYTOZOA*, 1.

aneously for a short time after being discharged from the spore-case of the parent plant. The motion is probably due to changes of hygroscopic or electric conditions, the purpose served being the wider diffusion of the seeds. Their cessation from motion after a time permits the seed to become fixed in order to germination. Zoospores occur in characeae, algae, fungi, and lichens.

PRONOUNCING VOCABULARY OF GREEK, LATIN, SCRIPTURAL, AND OTHER ANCIENT NAMES.

RULES AND DIRECTIONS FOR PRONUNCIATION.

The pronunciation indicated in the following list is that usually heard from educated speakers of English, who as a rule do not attempt to pronounce Greek or Latin or Scriptural names in the way in which they were pronounced by the ancients themselves—if that could be with certainty determined—but rather seek to assimilate the pronunciation to that of their own language. There is therefore no great difficulty in the pronunciation of such words, and by attention to the following rules and directions any name in the list can be sounded correctly.

Special knowledge required for the right pronunciation of these words is—

1. The seat of accent; and
2. The sound to be given to the letters as they stand in the word.

The syllable of the word which is to receive the accent is denoted by the usual mark, an acute accent, placed immediately after it, as the first syllable of the word *Ca'to*, the second of the word *Cam-by'ses*, and the third of the word *San-cho-ni'a-thon*. The seat of the accent varies considerably in words of more than two syllables, though it is never on the last syllable; in dissyllables it is always on the first. The pronunciation of the latter, therefore, as also of monosyllabic words, after the following remarks are studied, will present no difficulty, and consequently many of them (especially those belonging to the classical languages) have been omitted from the list below. The division into separate syllables is denoted by the mark - as well as by the accentuation mark. Two vowels coming together in a word, but having one or other of these marks between them, must therefore always be pronounced as belonging to different syllables.

The sounds to be given to the several letters will be considered under two general heads, viz.: 1. The vowel letters; and 2. The consonant letters. It must always be borne in mind that silent letters, so common in English (*e* final for instance), are the exception in the words here treated of.

I. THE VOWEL LETTERS.

The vowels heard in the words *fate*, *me*, *pine*, *note*, and *tube*, are called long vowels; while those heard in the words *fat*, *met*, *pin*, *not*, and *us*, are called short vowels.

1. When any of the vowel letters *a*, *e*, *i*, *o*, and *u*, constitute an accented syllable, and also when they end one, they are pronounced as long vowels; thus, in the first syllable of the words *Ca'to*, *Pe'lops*, *Di'do*, *So'lon*, and *Ju'ba*, they are pronounced as in the respective key-words *fate*, *me*, *pine*, *note*, and *tube*.

2. When the vowel letters are followed by one or more consonants in a syllable, they are pronounced as short vowels; thus, in the first syllable of the words *Ca'sca*, *Hec'u-ba*, *Cin'na*, *Cor'du-ba*, and *Pub'li-us*, they are pronounced as in the respective key-words *fat*, *met*, *pin*, *not*, and *us*.

3. When the letter *a* constitutes an unaccented syllable, as in *A-by'dos*, and when it ends one, as in *Ju'ba*, it is pronounced as *a* in *fat*.

4. The so-called diphthongs *æ*, *æ*, are always pronounced as the *e* of *me*, and are therefore simple vowel sounds, as in *Cæ'sar*, *Pæ'stum*, *Æ'o-lus*, *Bæ'o'ti-a*.

5. The digraph *ai* in a syllable is pronounced like *ai* in *wait*. It occurs only in Scriptural names. The *ai* of Greek words was pronounced like common English affirmative *ay*, or much the same as *i* in *pine*; but by the common spelling

it is Latinized into *æ*. An *a* and an *i* coming together, but belonging to different syllables, will of course have either the accent or the mark - between them.

6. When *r* follows *a* in the same syllable, and is itself followed by a consonant, as in *Ar'go*, *Car-tha'go*, the *a* is pronounced as in *far*. In such a word as *Ar'a-dus* it is sounded as in *fat*.

7. The digraph *au*, as in *Clau'di-us*, *Au-fid'i-us*, is pronounced as *a* in *fall*. An *a* and a *u* coming together, however, may belong to different syllables, as in *Em-ma'us*.

8. When *e* constitutes an unaccented syllable, as in the first of the word *E-te'o-eles*, and when it ends one, as in *E-vad'ne*, it is pronounced as *e* of *me*. And when *e* is followed by *s* as the final letter of a word, as in *Her'mes*, *Ar-is-top'h'a-nes*, it is always pronounced as *e* of *me*.

9. When *e* is followed by *r* in the same syllable, as in *Her'mes*, *Mer-cu'ri-us*, the *e* is pronounced as *e* of *her*. The letters *i*, *u*, and *y*, before *r*, have the same sound, as in *Vir'gil*, *Bur'sa*, *Cyr'nus*. When *er* is followed by a vowel, however, *e* is sounded as in *met*, thus *Er'a-to*, *Me'r'o-e*.

10. The digraph *ei*, as in *Plei'a-des*, is pronounced as *i* of *pine*. An *e* and *i* coming together, however, may belong to different syllables. Compare Rules 5 and 7.

11. The diphthong or digraph *eu*, as in *Leu-cip'pus*, *E-leu'sis*, *Ti-mo'theus*, is pronounced as *u* of *tube*. It occurs chiefly in Greek names. In other cases the *e* and *u* belong to separate syllables. Compare Rules 10 and 7.

12. When *i* constitutes the first and last syllables of words, whether accented or not, as in *I-be'ri-a*, *Fa'bi-i*, it is pronounced as *i* of *pine*. And *i* as the terminal vowel of a syllable at the end of words is also so pronounced, as in *Im'ri*, *A-ceph'a-li*.

13. But *i* at the end of any other unaccented syllable than the last, as in *Ind'i-a*, *Fa'bi-i*, is pronounced as *i* of *pin*.

14. In many cases *i* assumes the value of *y* consonant in English; thus *Aquileia* is pronounced as if *Aqui-le'ya*, *Caius* as if *Ca'yus*. This is especially common in the terminations of words.

15. *O* at the end of an unaccented syllable, as also when constituting an unaccented syllable by itself, is generally pronounced long or of medium length. Followed by *r* in the same syllable, as in *Go'rgus*, it is not usually pronounced long, but as *o* of *not*. The *o* in such a position is, however, by some speakers pronounced rather long than short, this being pretty much a matter of taste.

16. At the end of an unaccented syllable, or forming an unaccented syllable (as in *Æ's'u-læ*, *A-bi'hu*), *u* is pronounced much the same as when accented, but shorter. Following *y* it is pronounced as *y*; thus the second syllable of *Equicolus* is pronounced exactly as the English word *quick*.

17. The letter *y* is pronounced as *i* would be in corresponding positions; thus the *y* in *Ty'a-na* is as *i* of *pine*; and the *y* in *Tyn'da-rus* as *i* of *pin*.

II.—THE CONSONANT LETTERS.

The consonant letters, *b*, *d*, *f*, *h*, *j*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *v*, *y*, and *z*, have each but one sound, and as that is the English sound, they present no difficulty. The letters *c*, *g*, *s*, *t*, and *x*, have each more than one sound, and hence require rules to pronounce them aright.

1. *C* and *g* are hard, or sounded as in *call* and *gun* respectively, when immediately followed by the vowel letters *a*, *o*, and *u*, either in the same or in the following syllable, as in *Ca'sca*, *Cor-ne'li-a*, *Cur'ti-us*, *Hec'a-te*, *Hec'u-ba*, *Gallus*,

Gor'di-um, Au-gus'tus, Meg'a-ra, Teg'u-la. *C* and *g* are also hard immediately before other consonant letters, as in Clau'di-us, Cras'sus, Ec-bat'a-na, Hec'tor, Glau'cus, Gra'vi-us, Bag'ra-da, Bo-du-ag-na'tus.

2. *C* and *g* are soft when immediately followed by the vowel letters *e*, *i*, and *y*, either in the same or in the following syllable, as in Cer'be-rus, Cin'na, Cy-re'ne, Cic'e-ro, Tic'i-da, Gel'li-us, Gis'co, Gy'as, Vo-log'e-ses, Um-brig'i-us. In words such as Dacia, Sicyon, Phocion, Accius, Glaucia, Cap-pa-do'ci-a, the *ci* or *cy*, having the accent immediately before it, is often pronounced as *shi*: some authorities, however, retain the *s* sound in such words.

3. In Scriptural names, such as Megiddo, Gideon, *g* is always hard, except in the single word Bethphage. In consulting the list this will have to be kept in mind. The *s* following Scriptural names will serve as a guide.

4. When *c* and *g* are initial letters of a syllable, and immediately followed by *n* or by *t*, they are usually left silent in pronunciation; thus, Cneus is pronounced Ne'us; Gnidus, Ni'dus; and Ctenos, Te'nos. Some scholars, however, pronounce the *c* and *g* in these combinations; and should the reader elect to do so, he must pronounce them hard.

5. In Scripture names *h* often follows a vowel in the same syllable; as in Micah, Isaiah, Calneh, the vowel in these cases being pronounced with its short sound and the *h* being mute. In Greek names *rh* is equivalent to simple *r*.

6. The digraph *ch* is pronounced as *k*, thus, Achilles is pronounced A-kil'les; Chios, Ki'os; Enoch, E'nok. The Scripture name Rachel is the single exception to this rule, *ch* in it being sounded as in *chain*.

7. *S* as an initial of words is pronounced as *s* of the word *son*, as in So'lon, Spar'ta, Styx. It is commonly so pronounced as an initial of other than the first syllable of words, as in Su'sa, Si-sen'na; but in some exceptional cases the *s* receives the sound of *z*, as in the word Cæsar, which is pronounced Cæ'zar. These exceptions will be denoted by the direction '*s* as *z*,' inclosed within parentheses, thus, Cæ'sar (*s* as *z*). See also rule 10.

8. *S* final of words, when preceded by *e*, is pronounced as *z*; thus Aristides is pronounced Ar-is-ti'dez. And the *e* so placed is that of the word *me* as remarked already. But when the final *s* is preceded by any other vowel, it is pronounced as *s* of *son*, as in Archytas, Amphipolis, Abydos, Adrastus.

9. *S* at the end of words, when preceded by a liquid, *l*, *m*, *n*, or *r*, is pronounced as *z*, as in Mars, which is pronounced Marz; Aruns, A'runz.

10. *Si* forming an unaccented syllable, preceded by an accented syllable with a final consonant, and followed by a vowel, is commonly pronounced *shi*; as in Al'si-um, Hor-ten'si-us. When the *si* is preceded by a vowel it is very commonly pronounced as *zi*, as in Mæ'si-a, He'si-od, A-le'si-a, Cæ'si-us; and sometimes as the *s* of *pleasure*, as in As-pa'si-a, The-o-do'si-a. But the usage in these cases is not very well settled, and some scholars carefully preserve the pure sound of the *s*, and do not even in such situations allow it to degenerate.

11. When *ti* followed by a vowel occurs next after the accented syllable of a word, it is pronounced as *sh*; thus, Statius is pronounced Sta'shi-us; Helvetii, Hel-ve'shi-i; and similarly with Abantias, Actium, Maxentius, Laertius, &c. The proper sound of the *t* is preserved, however, when *ti* is accented or when it follows *s* or another *t*, as in Mil-ti'a-des, Sal-lus'ti-us, Brut'ti-i; so also in the termination -tion, as in A-e'ti-on. In such words as Domitius the *t* itself may be said to receive the *sh* sound: Do-mish'i-us.

12. The digraph *th* is pronounced as *th* of the word *thin*, as in Tha-li'a.

13. *X* at the beginning of syllables is pronounced as *z*, thus, Xenophon is Zen'o-phon. But at the end of syllables it retains its voiceless sound of *ks*, thus Oxus is pronounced Oks'us. If, however, the *x* end a syllable which immediately precedes a vowel in the accented syllable, then the *x* receives its voiced sound, that of hard *g* followed by *z*, as in Alexarchus, which is pronounced Al-egz-ar'chus.

14. The letter *p*, when initial, and followed by *n* or by *t*, is not usually uttered, as in Pnigeus and Ptolemæus, which are pronounced Ni'geus and Tol'e-mæ-us, though some persons sound the *p*.

15. *Ph* represents the Greek character φ, and is pronounced as *f*; thus, Philippi is pronounced Fi-lip'pi. But when *ph* is followed by a consonant in the same syllable, as in Phthia, it is usually omitted in utterance, and the word is pronounced Thi'a. Some scholars, however, pronounce it.

16. *Ps* represents the Greek character ψ, which as an initial is pronounced as *s*, the *p* being generally omitted in utterance, as in Psyche, which is pronounced Sy'ke. Many scholars, however, now pronounce the *p* as well as the *s* of *ps*.

17. As a general rule, when any combinations of consonant letters which are difficult to utter occur at the initial part of words, the utterance of the first may be omitted, thus, Tmolus may be pronounced Mo'lus; Mnemos; ne, Ne-mos'y-ne; while the digraph *ch* is dropped in Chthonia, making the pronunciation Tho'ni-a.

FORMS OF ADDRESS

IN CEREMONIOUS COMMUNICATIONS WITH PERSONS OF TITLE OR OFFICIAL POSITION.

Ambassador. The title 'Excellency' belongs especially to ambassadors, as well as to governors of colonies, and the Lieutenant of Ireland. Address letters 'His Excellency (with name or distinctive title following) Her Britannic Majesty's Ambassador and Minister Plenipotentiary to the Court of —'. Begin: 'Sir', 'My Lord', according as the ambassador possesses title or not. When personal reference is made say 'Your Excellency'.

An envoy extraordinary or chargé d'affaires, though inferior to an ambassador strictly so called, also usually receives the title 'Excellency'; and the wives of ambassadors are generally addressed similarly during their husband's tenure of office and while residing abroad.

Archbishop. Address: 'His Grace the Lord Archbishop of —'. Begin: 'My Lord Archbishop'. Refer to as 'Your Grace'. The most formal method of addressing the Archbishop of Canterbury is as follows: 'The Most Reverend Father in God, James (or whatever the Christian name is), by Divine Providence Lord Archbishop of Canterbury, Primate of All England and Metropolitan'. The Archbishop of York is addressed as 'The Most Reverend Father in God, —, by Divine Permission Lord Archbishop of York, Primate of England and Metropolitan'.

An Irish Archbishop is now addressed as 'The Most Reverend the Archbishop of —'.

An archbishop may be addressed as 'The Right Honourable and Most Reverend the Archbishop of —' if he have a claim to be called 'Right Hon.', apart from his ecclesiastical position.

In America the common form of address is 'The Most Reverend A—B—, D.D.'.

The wife of an archbishop has no special title in right of her husband's dignity, being only plain Mrs., and the same with the family.

Archdeacon. An archdeacon is styled 'Venerable'; 'The Venerable the Archdeacon of —'. Begin: 'Venerable Sir' or 'Reverend Sir', or 'Mr. Archdeacon' (especially in speaking).

Baron. Address: 'The Right Hon. Lord —'; less formally 'The Lord —'. Begin: 'My Lord'. Refer to as 'Your Lordship'.

Baron's Daughter. Barons' daughters are all entitled to be called 'Honourable'. Unmarried they are addressed as 'The Hon. A—B—', with Christian and surname. They retain the title 'Hon.' after marriage, the wife of a commoner being 'The Hon. Mrs.' with husband's surname, the wife of a knight or baronet being 'The Hon. Lady' with husband's surname. Begin 'Madam'; refer to as 'Your Ladyship' if so entitled by marriage. If a higher rank is conferred by the husband the title of course corresponds.

Baron's Son. All the sons are 'Honourable', with Christian name and surname. In Scotland the eldest son is addressed as 'The Hon. the Master of' (peerage title), or 'The Hon. (John), Master of'. Begin: 'Sir'.

The wife of a baron's son is 'The Hon. Mrs.' with husband's surname or both Christian name and surname. Begin: 'Madam'. If the daughter of an earl, marquis, or duke she must be addressed accordingly.

Baroness. Address: 'The Right Hon. the Baroness —', or 'The Right Hon. Lady —', or 'The Lady —'. Begin: 'Madam'; refer to as 'Your Ladyship'.

Baronet. Address: 'Sir A—B—, Bart.', giving Christian name and surname. The Christian name must be given; it is quite wrong to speak, for instance, of 'Sir Vernon Harewurt' where 'Vernon' is merely one of the surnames. Begin: 'Sir'.

A baronet's wife is addressed as 'Lady' with husband's surname (her Christian name would also be used if the daughter of a duke, marquis, or earl, and in this case she would also be 'Right Hon'). Begin: 'Madam'; refer to as 'Your Ladyship'.

Bishop. Address: 'The Right Rev. the Lord Bishop of —', or 'The Right Rev. A—B—, Lord Bishop of —', or simply 'The Lord Bishop of —'. Begin: 'My Lord Bishop', or simply 'My Lord'; refer to as 'Your Lordship'. In formal documents a bishop is styled 'The Right Reverend Father in God, John, by Divine Permission, Lord Bishop of —'. A bishop suffragan is addressed as 'The Right Rev. the Bishop Suffragan of —'. Begin: 'Right Rev. Sir'. Bishops' wives and families have no special recognition as such.

A bishop may have a title apart from his bishopric, in which case the two will be combined. See *Clergy*.

In Ireland the bishops of the Protestant church are now most correctly addressed as 'The Right Reverend the Bishop of —' (or in the case of Meath 'The Most Reverend'). Begin: 'Right Rev. Sir'. In Scotland the usage is the same—'The Right Rev. the Bishop of —', or 'The Right Rev. A—B—, Bishop of'; or 'The Right Rev. Bishop —' (with surname). Begin: 'Right Rev. Sir'. The Primate of the Scottish Episcopal Church is addressed as 'The Most Rev.' Begin: 'Most Rev. Sir'. Neither Irish nor Scottish bishops can claim to be spoken of as 'Lord Bishop', 'Your Lordship', though this is sometimes done. (Roman Catholic Bishops in Ireland are usually addressed by the title 'Most Reverend'.)

A retired bishop is still addressed as 'Right Reverend'; 'The Right Reverend Bishop —', 'Right Rev. Sir'. In America the form of address to a bishop is generally 'The Right Rev. A—B—'.

Canon. Address: 'The Rev. Canon —'. Begin: 'Reverend Sir'.

Cardinal. The special title of a cardinal as such is 'His eminence'. Begin: 'Your Eminence'.

Chargé d'Affaires. See *Ambassador*.

Clergy. The general form of address is 'The Reverend A—B—'. Begin: 'Rev. Sir', or simply 'Sir'. If a clergyman has a title (courtesy or other) it is proper to give it also; thus if he is the son of a duke or marquis he is to be addressed as 'The Rev. Lord A—B—'; if the son of an earl, viscount, or baron: 'The Rev. the Honourable A—B—', or 'The Hon. and Rev. A—B—'. If he is a baronet, 'The Rev. Sir A—B—, Bart.'.

Congress, Members of (U.S.). Addressed generally 'The Honourable A—B—'.

Consul. There is no special form of address to a person as such. 'A—B—, Esq.', if B. M.'s Consul, 'Consul-general', or as the case may be. In the U. States, however, a consul is commonly called 'Honourable'.

Countess. Address: 'The Right Honourable the Countess of —'. Begin: 'Madam'; refer to as 'Your Ladyship'.

Dean. Address: 'The Very Reverend the Dean of —'. Begin: 'Very Rev. Sir'; more familiarly 'Mr. Dean' (used in oral communications).

Doctor. The initials denoting the particular degree are placed after the usual form of address, whether D.D., LL.D., M.D., D.Sc., &c. 'The Rev. A—B—, D.D.'; 'A—B—, Esq., M.D.'. Less formally: 'The Rev. Doctor B—'; 'Doctor A—B—'.

Dowager. When the holder of a title marries, the widow of a previous holder of the same title becomes 'dowager', this being often inserted in addressing her: 'The Right Hon. the Dowager Countess of —'; 'The Dowager Lady —'. Instead of 'Dowager', to which some ladies object, the Christian name may be used: 'The Right Hon. Mary Countess of —'. Begin: 'Madam'; refer to as 'Your Ladyship'.

Duchess. Address: 'Her Grace the Duchess of —'. Begin: 'Madam'; refer to as 'Your Grace'.

Duke. Address: 'His Grace the Duke of —'. Begin: 'My Lord Duke'; refer to as 'Your Grace'. All the children of a duke are 'lords' or 'ladies', and are entitled to be called 'Right Honourable'. (See below.) Royal dukes are different. See *Prince*.

Duke's Daughter. Address: 'The Right Hon. Lady', with Christian name and surname, or simply 'The Lady', with Christian name and surname. Begin: 'Madam'; refer to as 'Your Ladyship'.

If married to a commoner or a peer by courtesy, the surname is derived from the husband's name or title; if to a peer the wife takes a title corresponding to her husband's.

Duke's Son. A duke's eldest son takes by courtesy one of his father's secondary titles, and is thus usually a marquis or an earl, being addressed exactly as if really a peer with the respective rank. His wife receives the corresponding title, being thus a marchioness or countess, and their eldest son takes also a courtesy title belonging to the family, being thus either a viscount or a baron.

A duke's younger son is addressed similarly to his sisters: 'The Right Honourable Lord A— B—', or 'The Lord A— B—'. Begin: 'My Lord'; refer to as 'Your Lordship'. Their wives are treated in a corresponding manner: 'The Right Honourable Lady A— B—', or 'The Lady A— B—'; 'Madam', 'Your Ladyship'.

Earl. Address: 'The Right Honourable the Earl of —', or 'The Earl of —'. Begin: 'My Lord'; refer to as 'Your Lordship'. The wife of an earl is a countess. (See above.)

Earl's Children. The eldest son of an earl (like the eldest son of a duke) takes a courtesy title from his father, and thus ranks either as a viscount or a baron, being treated as if really a peer and his wife as a peeress.

The younger sons of an earl are not called 'lord's' but are all called 'Honourable' (their eldest brother is 'Right Honourable') — 'The Hon. A— B—', the same as the sons of a baron. (See above.)

The daughters of an earl are all entitled to be called 'Right Honourable', and are addressed as the daughters of a duke, being all 'ladies', and thus somewhat different from their brothers. (See above.)

(Sir A— B—, The Right Honourable the Earl of, &c.), Governor of —'. Begin according to rank: refer to as 'Your Excellency'. A duke holding such a position would, however, be 'His Grace', 'Your Grace'.

Lieutenant-governors, as in India and the Dominion of Canada, are styled 'Honourable', 'His Honour', 'Your Honour'.

Governor of State (U.S.). Usually addressed as 'His Excellency'. 'His Excellency A— B—, Governor of —', or 'His Excellency the Governor of —'. A lieutenant-governor is called 'Honourable'.

In England and Ireland the judges of the supreme courts are called Lord Justices and Justices; in Scotland the judges are the Lords of Session. (See *Justice, Lord Justice, Lords of Session*.) In England the county court judges, however, are regularly called 'Judge'. 'His Honour Judge —' (surname); on the bench referred to as 'Your Honour'.

In many British colonies the members of the higher courts are called judges and addressed as 'The Honourable A— B—'. In the U. States the term judge is regularly applied to all such functionaries; and all are addressed in the same way.

Superficial measures include the square *pik*=6 sq. feet; the square *kassabah*=15 sq. yards; the *feddan*=about an acre.

Measures of weight include the *oke*=2.7 lbs.; the *cantar*=98 lbs.; the *ardeb* of wheat or maize=318.6 lbs.; of barley=237.6 lbs.; of rice=410.4 lbs. As a measure of capacity the *ardeb* is equivalent to about $5\frac{1}{2}$ bushels.

France. The system of weights and measures established in France as one of the consequences of the great revolution, and borrowed from France by many other countries, is known as the *metric system*, because it is based on the *mètre*. The *mètre* is about one ten-millionth of the distance from the equator to one of the poles measured along a meridian, and its length is equal to 39.37 inches or 3.281 feet; hence 11 mètres=12 yards. All the other measures of length are got either by subdividing or multiplying the *mètre* by 10, the French system being entirely decimal in character.

The chief subdivisions of the *mètre* are the *décimètre* or tenth of a *mètre*=3.937 inches, the *centimètre* or hundredth of a *mètre*=.3937 of an inch, or nearly $\frac{1}{2}$ of an inch or one-thirtieth of a foot; and the *millimètre*, or thousandth of a *mètre*=.039 or $\frac{1}{25}$ of an inch.

The chief multiple of the *mètre* is the *kilomètre* of 1000 mètres=3280.87 feet, or 1093.6 yds., or fully three-fifths of a mile (more correctly $\frac{621}{5}$ of a mile).

The chief weights are the *gramme* and the *kilogramme* (or 1000 *grammes*). The *gramme* is the weight of a cubic *centimètre* of distilled water, and the *kilogramme* is the weight of a cubic *décimètre* of distilled water at the temperature of 4° Centigrade or 39.1° Fahr. In English weight the *gramme*=.03527 oz. grains; the *kilogramme*=2.2 lbs. or 35.27 oz. The *quintal* or *centner*=220.4 lbs.; the *tonneau*=2204 lbs.

The measures of surface are mostly named after the corresponding measures of length; the square *centimètre*=.155 of a square inch, or 1 sq. inch=6.45 sq. centimètres; the sq. *décimètre*=15.5 sq. inches; the sq. *mètre*=10.76 sq. feet; the *are*=100 sq. mètres=119.6 sq. yards; the *hectare* (100 *ares*) the common measure for land=2.47 acres or 2 acres 2280 sq. yards (say 2½ acres). The square *kilomètre*=.386 of a square mile.

The chief cubic or solid measures are the cubic *centimètre*=.001 of a cubic inch; the cubic *décimètre*=61 cubic inches; and the cubic *mètre* or *stère*=35.3 cubic feet or 1.3 cubic yard. Hence 1 cubic yard=.764 of a cubic *mètre*.

The standard measure of capacity is the *litre*=61 cubic inches or 1.76 pint or .85 of a quart. The *centilitre*, or one-hundredth of a *litre*=.07 of a gill; the *décilitre*=.7043 of a gill; the *décilitre* (or ten litres)=2.2 gallons; the *hectolitre* (100 litres)=22 gallons=2.75 bushels; the *kilolitre* (1000 litres)=220 gallons=27½ bushels=3.44 quarters.

Germany. Since 1872 the French metric system has been in force throughout the German Empire, the French designations having been adopted with little change, though vernacular German terms are also in use. Thus there are the *meter* or *stab*, the *zentimeter* or *strick*, the *millimeter* or *neuzoll* ('new inch'), the *dekameter* or *kette* ('chain'), the *liter* or *kanne*, the *schoppen* or half-litre, the *scheffel* or bushel=50 litres; the *zentner* or hundredweight=50 kilograms; the *pfund* or pound=half a kilogram; the *tonne* or ton=1000 kilograms. See FRANCE.

The German *meile* or mile=4.68 English miles; the German geographical mile=one fifteenth of a degree of the equator.

Greece. The French metric system has been long established, the *mètre* being called the *pécheus* or cubit, the *kilomètre* the *stadion*, the *décimètre* the *palamé*, the *centimètre* the *daktylos*, the *millimètre* the *grammé*. The *litre* is called the *litra*, the *décilitre* the *kotylé*, the *hectolitre* the *kolan*. The *gramme* is called the *drachmé*, and 1500 drachmá=1 *mina*=1½ kilogramme=3.3 lbs. The *oke*=2.84 lbs. The *are* is called the *stremma*. See FRANCE.

Guatemala. See CENTRAL AMERICAN STATES.

Guiana, British. Same as Britain.

Haiti. Same as France.

Holland. See NETHERLANDS.

Honduras. See CENTRAL AMERICAN STATES.

Honduras, British. Same as Britain.

Hong-Kong. British weights and measures are in use; also those of China (which see).

India. By the Indian Weights and Measures Act of 1871 the standard of weight is the *ser*, which is equivalent to the French kilogramme or 2.2 lbs. The standard measure of capacity is also called the *ser*, and corresponds to the French litre or 1.76 of a pint. A common measure of weight is the *seer* (of 80 *tolahs*)=2.057 lbs. The *maund* of Bengal is 40 *seers* or 82½ lbs. The *maund* of Bombay=28 lbs., of Madras=25 lbs.

The English measures of length are to some extent in use. Others include the *guz*, which in Bengal corresponds to the yard; in Bombay=27 inches; in Madras=33 inches. The *cross*=2000 yards; the *beegah* (of Bengal)=1600 square yards.

SIGNS AND SYMBOLS

USED IN WRITING AND PRINTING.

MATHEMATICAL.

+ Plus, the sign of addition or increase; as, $a+b+c$ (read a plus b plus c); also marks a positive as opposed to a negative quantity.

- Minus, the sign of subtraction, diminution, or decrease; as, $a-b-c$; also marks a negative as opposed to a positive quantity.

± Plus or minus, leaving it doubtful whether a quantity is to be added or subtracted; one or other as the case may be.

× The sign of multiplication; multiplied by or into; as, $a \times b$, or 3×5 .

÷ The sign of division; divided by; as, $a \div b$, $24 \div 6$. Division is also indicated by placing one quantity above another with a horizontal line between; as, $\frac{a}{b}$, $\frac{24}{6}$.

~ The difference between two quantities, leaving it doubtful which is the greater; as, $a \sim b$.

= The sign of equality; equals; is equal or equivalent to; as, $a=b$, $10+2=12$.

> Is greater than; as, $a > b$, a is greater than b .

< Is less than; as, $a < b$, a is less than b .

∝ Varies as, said of a quantity that increases or diminishes according as another quantity increases or diminishes; as, $a \propto b$.

: Is to, :: as; signs used to indicate ratio or proportion; thus, $a:b::c:d$, that is, a is to b in the same ratio as c is to d ; $3:5::6:10$.

∴ Because or since, ∴ $a=b$ and $c=d$, ∴ $a+c=b+d$; that is, because a is equal to b , and c is equal to d , therefore $a+c$ is equal to $b+d$.

∞ Indefinitely great; infinity.

0 Indefinitely small; a quantity less than any assignable quantity; zero.

√ The radical or root sign. When used alone it indicates the square root; as, \sqrt{a} , $\sqrt{16}$.

Higher roots are indicated by small figures called indices, thus, $\sqrt[n]{a}$, $\sqrt[3]{a}$, $\sqrt[4]{a}$, $\sqrt[5]{a}$, that is, the cube root of a , the fourth root of a , the tenth root of a , the n th root of a . The same roots might also be indicated by small fractions, as, $a^{\frac{1}{3}}$, $a^{\frac{1}{4}}$, $a^{\frac{1}{5}}$, and so on.

So also the powers to which quantities are raised are indicated by similar small figures or indices, thus, a^2 , a^3 , a^4 , a^5 , &c.

{, [,] } Indicate that the quantities enclosed are to be treated together as forming a single term or expression; as, $2(a+\frac{b}{c})^2$.

∠ Angle, the angle; as, $\angle ABC$, the angle ABC .

π The number 3.1415926... that is, the ratio of the circumference of a circle to its diameter, approximately equivalent to $\frac{22}{7}$ to 1, or 22 to 7.

° Degree or degrees, whether of a circle or of temperature; as, 32° the freezing point of water (Fahr.), 360° the whole circumference of a circle.

' Minutes in circular measurement, as, $6^\circ 20'$, six degrees twenty minutes.

" Seconds in circular measurement; as, $60''$, sixty seconds.

°, °', °'' are used also to denote feet, inches, and lines.

By means of chemical symbols, or formulas, the composition of the most complicated substances can be very easily expressed, and that, too, in a very small compass. An abbreviated expression of this kind often gives, in a single line, more information as to details than could be given in many lines of letterpress.

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine.

When a symbol has a small figure or number under-written, and to the right of it, such figure or number indicates the number of atoms of the element. Thus O_2 signifies two atoms of oxygen, S_5 five atoms of sulphur, and C_{10} ten atoms of carbon.

When two or more elements are united to form a chemical compound, their symbols are written one after the other, to indicate the compound. Thus H_2O means water, a compound of two atoms of hydrogen and one of oxygen; $C_{12}H_{22}O_{11}$ indicates cane-sugar, a compound of twelve atoms of carbon, twenty-two of hydrogen, and eleven of oxygen.

These two expressions as they stand denote respectively a molecule of the substance they represent, that is, the smallest possible quantity of it capable of existing in the free state. To express several molecules a large figure is prefixed; thus, $2H_2O$ represents two molecules of water, $4(C_{12}H_{22}O_{11})$ four molecules of cane-sugar.

When a compound is formed of two or more compounds the symbolical expressions for the compound are usually connected together by a comma; thus, the crystallized magnesic sulphate is $MgSO_4, 7H_2O$. The symbols may also

be used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the substances as they exist before the change, the other the result of the reaction. Thus, $2H_2+O_2=2H_2O$ expresses the fact that two molecules of hydrogen, each containing two atoms, and one of oxygen, also containing two atoms, combine to give two molecules of water, each of them containing two atoms of hydrogen and one of oxygen.

## THE SAME PASSAGE CORRECTED.

I wonder if any man is as clever as he imagines himself. I know I have not the confidence in myself I had a month ago as an amateur cook. I think it was my friend Davidson who first put the idea in my head to try my hand at cooking. The way he would describe the cooking of steaks on his yacht would make any one's mouth water, and it seemed to be always steaks they had. I asked him how he learned to cook, and he gave me the secret in one lesson.\* He said, "You just use plenty butter; that's how women can't cook properly: they grudge butter". It is five or six years since he first told me about his wonderful powers as a cook, and I have often longed for an opportunity to emulate him in the art. Davidson always got quite enthusiastic on this subject. He would say, "Man, when it was my turn, the fellows could hardly be kept on deck after the onions began to brown and the smell went up; and the doctor used to stand with a big rolling pin to keep Jamie and the rest of them back, and every minute they would be crying down that it would do fine".

I don't know anything about yachting, and any time I have been over two hours at sea I had no taste for food. I always had more than I wanted. I remember going to Dublin, and at breakfast a tureen of ham and eggs was placed beside me, but by the time I had helped the company I had to go on deck and admire the prospect. An idea occurred to me, however, to get some companions to join me on a holiday with a caravan. "I would attend to the cooking," I said; but I never got any one to agree. I believe now if I had promoted each one to the office of cook I would have been successful, for I think every man—who has not tried it—is sure he is a born cook.

# DESCRIPTION OF THE PLATES.

## PRECIOUS STONES.

### ILLUSTRATIONS OF SOME OF THE MORE IMPORTANT.

A CERTAIN number of rather rare minerals get the name of precious stones or gems, all of them being possessed of great hardness and also of great beauty, especially when cut and polished, and all being highly valued as personal ornaments. It is difficult to give a complete or definite list of such stones, since from the most rare and beautiful among them downwards there is a gradual decrease in value and rarity, and it is impossible to say where to draw the line between what are distinctly precious stones and what are simply ordinary and commonplace mineral bodies. Fashion has also something to do with this matter, as a stone may be highly prized and commonly worn as an ornament at one period or among one community, and comparatively neglected at another period or by another community. Some precious stones, however, from their beauty and rarity have always and everywhere fetched a high price, more especially the diamond, ruby, sapphire, emerald, and oriental amethyst. These then hold a place in the front rank of precious stones, while in secondary order come a number of stones such as spinel, topaz, common or occidental amethyst, turquoise, beryl, opal, garnet, tourmaline, chrysoberyl, jargoon (or jargon), agate, cairngorm, &c. The nomenclature of precious stones is not very well settled, and therefore confusing, since jewellers and lapidaries may apply the same name to stones that are essentially different in their nature and that are named differently by the mineralogist. The name ruby, for instance, is applied to other stones besides the true or oriental ruby. The terms *oriental* and *occidental*, it may be remarked, are used in a peculiar sense in regard to precious stones, the former implying genuineness or superior quality, the latter implying inferiority, and neither having reference to locality or place of origin. It is not the matter of which precious stones are composed that gives them their value, since they mainly consist of ingredients very common in nature; it is their crystalline character, hardness, lustre, transparency, colouring, capacity for polishing, &c., that make them so highly prized. The diamond, it is well known, consists of pure carbon, while alumina (the main ingredient of common clay), silica, fluorine, magnesia, lime, &c., form the chief ingredients of some other precious stones. Their colours are generally due to minute admixtures of certain metals (such as copper and iron) in combination with other substances. The diamond is the hardest of all known substances, its hardness, in the scale used by mineralogists, ranking as 10. In beauty and value it stands first among precious stones, though the ruby, if of the weight of two or three carats, usually fetches a higher price. It is found of all colours, though generally colourless. Its beauty when cut is owing to its refracting powers, by which it throws back much of the light that falls upon it. The ruby and sapphire belong to what is known as the corundum group of stones, which are all mainly composed of alumina, and are next in hardness to the diamond. The ruby proper is to be distinguished from the red spinel or balas ruby, which it greatly resembles in appearance, though the latter is a compound of alumina and magnesia. The ruby is rose-red, crimson-red, or blood-coloured. The sapphire is distinguished by its azure-blue colour, though white sapphires are also known. Emory, we may remark, is an amorphous form of corundum, so that the ruby and sapphire are practically crystalline forms of this humble substance. The emerald is a stone of a rich and beau-

tiful green colour, consisting of silica, alumina, and glucina, with oxide of chromium giving the green tint. When of fine colour and quality it is one of the most precious of gems. Beryl is closely akin in composition, but is of comparatively little value. Chrysoberyl consists of alumina and glucina, and is next to the sapphire in hardness; it often presents a fine, opalescent play of light. The topaz is colourless or of various colours, yellow, orange, blue, pink, &c. It consists chiefly of silica and alumina. Colourless specimens when cut closely resemble diamonds, but the topaz is rendered very electric by heat or friction, which the diamond is not. The garnet forms a group of minerals varying considerably in composition, though silica is always an important ingredient. The prevailing colour is red of various shades; but brown, green, yellow, and black garnets are known. Tourmaline is a mineral of somewhat varied composition and colouring, some varieties being transparent, some opaque, some colourless, others green, brown, red, blue, and black. It often occurs in granitic rocks. The opal is a pellucid gem of various colours consisting of silicate with about 10 per cent of water, and is very brittle. It is characterized by its iridescent reflection of light, and is divided into many varieties, such as the precious or noble opal, which exhibits brilliant and changeable reflections of green, blue, yellow, and red; and the common opal, whose colours are white, green, yellow, and red, but without the fine play of colour. The turquoise is a greenish-blue opaque stone, consisting essentially of a phosphate of alumina, containing a little oxide of iron and oxide of copper. The true turquoise is only found in one locality in Persia. A number of beautiful gems are mere varieties of the common mineral quartz. Among these are amethyst, sard (chalcedony), blood-stone (heliotrope), agate, citrine, cairngorm, cat's-eye, rock-crystal, and various others. The ordinary or occidental amethyst (shown on the plate) is a violet-blue or purplish variety often used in jewelry, but too common to have a very high value. The oriental amethyst, which is of a similar colour, is a rare and valuable gem of the same class as the ruby and sapphire. The bloodstone is well known by its green colour and red spots. The agate is remarkable as consisting of a number of layers or bands of various colours blended together. When the stone is cut and polished the manner in which the colours are arranged often produces peculiar effects, giving rise to such names as moss-agates, star-agates, ribbon-agates, &c. The sard is noted for its waxy lustre, and the cat's-eye for its fibrous texture. The cairngorm takes its name from the mountain on the borders of Banffshire and Aberdeenshire, whence the finest Scottish specimens are obtained. The citrine and cairngorm are similar in appearance, and specimens of both sometimes receive the name of smoky quartz from their characteristic colour. The gem called peridot is a variety of the mineral chrysolite or olivine, which is composed of silica, magnesia, and iron. The green transparent varieties of chrysolite receive this name, the green being usually some shade of olive or leek green. Peridot is a rather soft gem, difficult to polish, and liable to lose its lustre and to suffer by wear. Jargoon or jacinth is the name given to transparent, bright-coloured varieties of the mineral zircon, of various shades of red, this mineral appearing also with other colours, as green and blue. Fine specimens of jargoon show a peculiar golden lustre. Jewellers often give the name jacinth

or hyacinth to varieties of garnet or of quartz. Colourless specimens of zircon are sometimes passed off as diamonds, having a good fire and lustre when polished, but of course they are far inferior in value as they also are in hardness. The mineral sphene or titanite contains the somewhat rare metal titanium. It is of a yellowish or greenish-yellow colour, and the transparent varieties often display brilliant effects of light and colour.

The examples of precious stones shown on the plate have been selected for their representative character rather than for any individual interest which they possess. The diamond and the uncut ruby, however, have a certain extrinsic value inasmuch as they were both presented by Mr. Ruskin in 1887 to the natural history department of the British Museum—the diamond “in honour of his friend, the loyal and patiently adamantine First Bishop of Natal” (whence it is known as the Colenso Diamond); and the ruby, the Edwardes’ Ruby, “in honour of the invincible soldiership and loving equity of Sir Herbert Edwardes’ rule by the shores of Indus”. The diamond is one of the S. African pale-straw-coloured stones, and is a

particularly perfect crystal. Some of the examples on the plate exhibit the gem in its natural state and also cut, as in the case of the ruby, sapphire, spinel, and garnet. The garnet is shown in three different forms, as a native crystal (from Fort Wrangell, Alaska), as a cut faceted stone, and also cut in the peculiar concave-convex form in which it receives the name of “carbuncle”. The beautiful example of beryl or aquamarine surrounded by crystals of topaz was found in the mountains of the Nerthchinsk district, Transbaikalia (Siberia). The blue topaz, a very fine crystal, came from the government of Perm in Russia; the emerald from Santa Fé de Bogotá, Columbia, whence the finest emeralds have long been obtained; the sard and the blood-stone from India; the amethyst from Brazil; the opal from Queensland; the agate from Oberstein, Birkenfeld (Rhine valley), a famous locality for such stones; the spinel from Bnrmah, the large uncut stone from the palace at Ava; the peridot from an island in the Red Sea; the chrysoberyl from Ceylon; the turquoise from Arabia Petrea; the rock-crystal from Brazil; the cat’s-eye or tiger-eye (crocidolite) from S. Africa, where many such stones are found.

## MAMMALIA.

### ILLUSTRATION OF TERMS RELATING TO THE STRUCTURE AND CLASSIFICATION OF MAMMALS.

THE Mammals or Mammalia (from *L. mamma*, a breast or pap) form the highest class at once of the vertebrate animals and of the whole animal kingdom, and include all those animals that are familiarly termed ‘quadrupeds’, the whales and other fish-like creatures, and also man himself. They may be defined as animals that nourish their young for a longer or shorter period by milk, a fluid secreted in certain special glands (the mammary glands), and that possess a typical body-covering of hair. The possession of mammary glands and the nature of their body-covering sufficiently distinguish mammals from all other animals, though some mammals, as the whales, are almost hairless; and in certain others, as the hedgehog, the armadillo, &c., we find spines and horny or bony plates developed as a body-covering.

The skeleton of mammals exhibits a general plan of structure with which we are all tolerably familiar, as in most essential points it corresponds with what our own bodies possess. The vertebral column or spine may generally be divided into the definite regions of the neck, back, loins, sacral region, and tail, caudal, or coccygeal region. In man, monkeys, and certain bats the lowest number of vertebrae is found. The neck vertebrae are, with very few exceptions, seven in number, as in man, whatever the length of the neck. Thus the long-necked giraffe and the short-necked porpoise have the same number of bones in the neck. The dorsal or back vertebrae average thirteen in number; the lumbar vertebrae or those of the loins are very various in number; the sacral vertebrae (which in man unite to form a single bone) are rarely more than five; the coccygeal vertebrae (which in man become ossified to the sacrum) in long-tailed animals number from 30 to 46. The first cervical vertebra, called the *atlas*, supports the head, which fits into it by means of two articular processes of the posterior bone of the skull called the *occipital condyles*. The second vertebra (the *axis*) has a blunt process on which the atlas, together with the skull, turns. In birds and reptiles there is only one occipital condyle. From the vertebral column spring the ribs, which inclose the cavity of the chest or thorax. These bones vary greatly in number, but generally correspond to that of the dorsal vertebrae. They are divided into *true* and *false* ribs, the former being those that are joined to the *sternum* or breast-bone.

The limbs in mammals, like those of all the other vertebrate animals, are never more than four in number. The fore-

limbs are invariably present, but in the whales and kindred animals the hinder limbs are absent. The limbs assume a considerable diversity of forms, from the arm and hand of man to the flipper of the whale. In the bats the digits or fingers of the anterior limbs are extremely elongated, and are united by a membrane through which the animal is enabled to fly. The bones of the fore-limb in mammals are the *humerus*, or long bone of the upper arm; the *radius* and *ulna*, or bones of the fore-arm, which may be fused together, and the latter of which is often rudimentary; the *carpal* bones, or those of the wrist; the *metacarpal* bones, succeeding the wrist; and lastly the *phalanges*, or bones of the fingers or digits. The bones of the posterior limb are normally the thigh-bone or *femur*; the two bones of the lower limb, viz. the *tibia* and *fibula*; the bones of the ankle, or *tarsus*; and the phalanges of the toes. The *pelvic* bones are those connecting the posterior limbs to the framework of the skeleton. The digits (fingers or toes) are normally five in number, but they may be reduced to one, as in the horse, in which the single digit represents the middle finger of man. Each digit has three phalanges, except the thumb, which has only two.

The skull is composed of various bones firmly united together, the *sutures* or lines of union being in most mammals distinctly visible. The jaws consist of various bones firmly united together, the parts corresponding to bones that are actually seen to be distinct in lower animals. The lower jaw or *mandible* is directly articulated to the skull, and not, as in birds and reptiles, by the intervention of a separate bone. Teeth of various forms are present in the great majority of animals. In the echidna, pangolin, and ant-eater, however, they are entirely absent; and the whalebone whales have them only in the fetal or embryonic state, and as the animal advances they disappear. The teeth are always lodged in special sockets (*alveoli*), and not ossified with the jaw-bones as in lower animals. The number of teeth varies greatly throughout the class. Man has 32 in his permanent set, a large armadillo has 90, while in the dolphins as many as 220 may be found. In form the teeth vary greatly, as is natural when we consider the vast differences in the diet of different animals. They are divided into *incisors*, *canines*, *premolars* or *false molars*, and *molars*, the *incisors* being in front and followed in the above order by the others. All these four kinds may not be present together. In most mammals two sets of teeth occur—a temporary or deciduous

set (*milk teeth*) and a permanent set. Some animals have only one set, which continue through life, and they are therefore termed *monophyodont*; animals that have two sets are called *diphyodont*. From the form, number, and disposition of the teeth valuable characters in the classification of the mammalia are drawn.

Of the internal organs of the mammals the stomach is the one that displays the greatest diversity of structure. Though generally simple it often exhibits a division into compartments, this being especially remarkable in the case of the ruminating animals. The chest or thorax is always separated from the abdomen by a complete *diaphragm* or 'midriff', constituting a great muscular partition between these cavities, and acting as a most important agent in the movements of respiration. Such a muscular partition is not found in other vertebrates. The reproductive organs vary exceedingly in their conformation. In the lower mammals (kangaroos, duck-mole, &c.) the female possesses two distinct uteri or wombs, and hence these animals are known as *didelphous* (Gr. *dis*, double, *delphys*, womb), while all other mammals are *monodelphous*. Another point in regard to the reproduction of the mammalia is the presence or absence of a placenta in the females. This structure, familiarly known as the 'after-birth', is developed on the outside of the envelopes inclosing the fetus, and is so closely connected with the wall of the womb as to allow of an interchange of blood between the mother and the fetus or embryo. Certain animals (kangaroos, duck-mole, echidna) do not possess this organ, and are therefore called *implacental* or *non-placental*. The placenta, again, may be either *deciduate* or *non-deciduate*, according as certain tissues belonging to the maternal womb are cast off at birth or not.

The *mammary* or *milk glands* form the feature to which this class of animals owes its name. All mammals possess these glands, which, however, differ considerably in number and position throughout the class. They may be seen in the males as well as the females, but in the former they are undeveloped and functionally useless. These glands are placed in the ventral or lower surface of the body, and their number varies from two to twenty-two. They may be situated on the breast, being then called 'pectoral', or farther back and on the abdominal surface, being then called 'ventral' or 'abdominal'; in some cases they are in the groin ('inguinal'). In ruminants the glands are united so as to form the udder, from the surface of which rise the teats. In the marsupials (kangaroos, &c.) the teats are contained within the characteristic *marsupium* or pouch. The young of these mammals do not require to suck, nor at first are they able to do so, but there are special muscles by which the parent can eject the milk into their mouths.

The orders into which the mammals are generally divided are given below. It may be mentioned that man is often classed in one order (Primates) with the Quadrumana, a method which is quite legitimate if regard is had merely to structural or anatomical characteristics.

#### Order I.—BIMANA (Two-handed). Man.

Characters: posture always erect, progression bipedal, the lower limbs being exclusively devoted to this purpose; anterior limbs shorter than posterior, and exclusively used for prehension; thumb can be opposed to the other digits; great toe or hallux not opposable to the other digits; teeth forming a nearly even and uninterrupted series; brain proportionately larger than in any other animal, and with large and deep convolutions.

#### Order II.—QUADRUMANA (Four-handed). Apes, baboons, monkeys, lemurs, &c.

Characters: both hindfeet and forefeet usually prehensile, that is, the innermost toe of the hind limb is opposable to the others as well as the innermost of the fore limb, so that the animals are really four-handed (though the thumb of the fore limb may be wanting, and sometimes is not opposable); fore limbs often longer than the hind limbs; teats regularly two in number and pectoral in position; placenta deciduate; teeth uneven and interrupted by a diastema or interval.

Section A.—*Catarrhina*. Nostrils placed close together, aperture oblique and pointing downward; thumb of fore limb opposable. Apes and monkeys, found only in the Old World.

Section B.—*Platyrrhina*. Nostrils placed far apart; thumb of fore limb absent or not opposable; tail prehensile. Monkeys of South America.

Section C.—*Strepsirrhina*. Nostrils curved or twisted. The lemurs and their kindred, inhabiting Madagascar, Africa, and Eastern Archipelago.

Order III.—INSECTIVORA (Insect-eaters). Moles, Hedgehogs, Shrews, &c.

Characters: Molar teeth always serrated, and having numerous sharp cusps, so as to adapt them for crushing the insects on which they feed; usually five toes on all feet, and toes furnished with claws; walk on the soles of the feet (plantigrade); placenta deciduate.

Fig. 6.—Hedgehog (*Eriacus europæus*).

Fig. 6a.—Skull of Hedgehog. The reference letters correspond with those of fig. 2, the bones having the same names.

Order IV.—CHIROPTERA (Wing-handed). Bats.

Characters: Mammals adapted for flight, the four fingers of the hand being greatly elongated, so as to support a flying-membrane, which extends along the sides of the body uniting the fore and hind limbs of each side and frequently the hind limbs and tail; thumbs of the fore limbs of normal size; digits of the hind limbs of normal length and character; clavicles or collar-bones well developed; teeth of three kinds, the canines always well developed; teats pectoral, and two or four in number. The bats are divided into two sections, one of them containing the *insectivorous* bats, the other the *frugivorous* or fruit-eating bats. Many of them have a curious leaf-like appendage on the nose.

a Molars. b Canines, large and well developed. c Incisors.

Order V.—RODENTIA (Gnawers). Rats, Mice, Hares and Rabbits, Beaver, &c.

Characters: Two long curved incisor teeth in each jaw (in upper sometimes four), separated from the molars by a wide interval; no canine teeth; molars and premolars few in number; feet usually with five toes, all having claws; teats generally numerous; placenta deciduate. The most notable feature in these animals is the incisors, which continue to grow through life, and present a chisel-like form from the hard enamel in front projecting above the comparatively soft dentine behind, which wears away more rapidly by gnawing.

The order is divided into three well-marked sections.

Section A.—*Digitigrada*. Animals that walk on their toes, the heel being raised above the ground, as the Lion, Tiger, Dog, &c.

Section B.—*Plantigrada*. Animals that walk on the sole of the foot, the heel being little or not at all raised, as the Bears.

Fig. 21.—Indian Elephant (*Elephas Indicus*). Ears much smaller than in the African species.

Order VIII.—HYRACOIDEA. The Hyrax.

Characters: No canine teeth; upper incisors long and curved and growing from permanent pulps as in the Rodentia; lower incisors straight; molars resemble those of the rhinoceros; four inguinal teats, and two in the axillæ or arm-pits. There is only the genus Hyrax in this order, one species of which is the 'coney' of Scripture.

This order comprises three of the orders established in former systems of classification, namely, Ruminantia, Solidungula (Horses), and Pachydermata (Rhinoceros, &c.), which now form subdivisions of this large assemblage of animals. It is divided into two chief sections.

Section A. *Perissodactyla* (Odd-toed). Rhinoceros, Tapir, Horse, &c. Hindfeet always and forefeet generally odd-toed; stomach simple and not divided into compartments.

Section B. *Artiodactyla* (Even-toed). Hippopotamus, Pig, and all the Ruminants. Toes always two or four in number; stomach always more or less complex or divided into compartments.

## RENAISSANCE ARCHITECTURE.

### ILLUSTRATIONS OF ITS CHARACTERISTIC FEATURES IN THE 15TH, 16TH, AND 17TH CENTURIES.

THE ancient classic architecture of Rome, which was more or less borrowed from that of Greece, continued in use until the time of the Emperor Constantine, in the fourth century of our era, when the empire was transferred to Byzantium, henceforth called Constantinople. The style, however, becoming more and more debased as time went on, it fell mainly into two divisions, which have been denominated Romanesque or Byzantine, according as they exhibit the influence of Rome or that of Constantinople. During the middle ages and after the fall of the Roman Empire other styles were introduced, such as Saracenic, Moorsque, and Gothic. But in Italy Classic art clung so tenaciously to the soil that no other style ever became naturalized; and as the Romanesque prevailed in Rome itself during the whole period of the middle ages, it was an inevitable consequence that Classic architecture should supersede Medieval in that country. This revival to a purer art was practically commenced in Florence about the beginning of the fifteenth century, and it soon spread with great rapidity over Italy and the greater part of Europe. This time of revival has been distinguished by the Italians as the *Cinque-cento* period<sup>1</sup> (fifteenth century), but by the French it has been called the *Renaissance*. This latter term has become more generally adopted, from the style being a revival of the ancient architecture of Greece and Rome, and is

<sup>1</sup> But this in our mode of reckoning indicates the sixteenth century.

applied to all modern classic work designed after the Italian manner.

One of the earliest architects of the revival was Brunelleschi (1377-1444), who after having studied antique art in Rome returned to Florence, his native city, in 1407, and was intrusted with the completion of the cathedral there. By him the great dome was erected—a work in size second only to that of St. Peter's at Rome, for which, it is probable, it served as a suggestive model to Michael Angelo. But the most complete work of Brunelleschi is the church of San Spirito at Florence (figs. 1 and 2). It is formed on the Latin cross, and the ceiling is flat and of wood. A contemporary Florentine architect, Alberti (1404-1488), assisted enthusiastically in the new movement, and erected the church of St. Andrea at Mantua besides other churches which have been justly admired. He also wrote a work on architecture, which is the foundation of all that has been since written on the art. It has been translated into all modern languages, and still deserves an attentive perusal by those who intend becoming architects.

The great hospital at Milan is an early example of this period, having been commenced in 1457 by Filarete, a Florentine architect. Fig. 9 represents a portion of one of the courts, of which there are several, but parts of them are new built up and disfigured by additions. When all the arcades were open, as here shown, they must have been very effective

architecturally. The design is somewhat mediæval in character, as all the external windows are pointed and adorned with quasi-Gothic mouldings. To the northern face of this hospital, Bramante added a portico or corridor of the Ionic order.

St. Peter's at Rome (fig. 8), the grandest work of the modern classic school, was commenced in 1506 by Bramante (1444-1514), but it made slow progress. After the death of that architect, he was succeeded by Raphael (1483-1520), upon whose early death Peruzzi (1481-1536) was appointed. He was succeeded again by the celebrated San Gallo (1470-1546), who remodelled the whole design, but it does not appear that much was done towards carrying it out. All San Gallo's time and funds were employed in strengthening the piers of the great dome, and remedying the defects in construction made by his predecessors. After the death of San Gallo the work was committed to Michael Angelo (1474-1564). He strongly opposed San Gallo's design and greatly modified it, infusing new vigour and character into the work, although he could not alter the plan. To the consummate skill of this artist we owe the magnificent stone dome; the largest and loftiest work of the kind which has been ever erected in ancient or modern times. The church was not completed even at the death of Michael Angelo, who, however, had the satisfaction of seeing the dome practically finished. He left a model for the cupola to be erected upon the dome, which was faithfully built in accordance with his design. The East or Entrance front<sup>1</sup> (fig. 8) is the work of Carlo Maderno (1556-1629). It extends in breadth far beyond the width of the nave, is formed of gigantic engaged columns, and the order is surmounted by a very lofty attic which adds to the height of the front without adding to its beauty. Maderno also completed the nave and other portions of the church; this, however, was not done until a century had elapsed from the time that the foundation was laid by Bramante.

Other developments of the Renaissance were carried out in other Italian cities, but more especially in Venice, which produced a vast combination of talent. Among the great architects of Venice stands conspicuously Sansovino (1479-1570), whose masterpiece is the well-known Library of St. Mark, an end view of which is shown in fig. 7. It consists of two orders, the lower one Roman Doric and the upper one Ionic. The upper entablature is remarkable for its great height, and contains small windows besides the beautiful sculptures by which it is decorated. The whole is crowned by a balustrade with figures upon the piers said to have been sculptured by the pupils of the architect. The lower story is an open arcade which is raised three steps above the level of the piazza. The campanile of the Greek church, Venice (fig. 6), is also the work of Sansovino, the design being evidently founded on the earlier campanile of St. Mark.

The greatest name of the period (coming, however, a little later) is that of Andrea Palladio (1518-1580), whose buildings are so numerous both at Venice and Vicenza, and are so remarkable for his own peculiar treatment, that they gave rise to the term "Palladian school."<sup>2</sup> His church of San Giorgio Maggiore at Venice (fig. 3) is an example of his fertility of invention. Before his time the order in front of a church, when divided into nave and aisles, was carried across the whole building of the same height, leaving portions of the front false, over the lean-to roofs of the aisles; or two orders were adopted, one placed above the other. Palladio, by placing a larger order on pedestals (as seen in the example) and adding a smaller one on the floor line, overcame the difficulty in a very masterly manner.

The palaces erected in Rome, Venice, Florence, and other Italian cities during the sixteenth century were very numerous, and are among the finest architectural works in Europe. Of these the Farnese palace at Rome by San Gallo, the Pitti

and Strozzi<sup>3</sup> palaces at Florence, and the Vandramini palace<sup>4</sup> at Venice are among the most celebrated.

The Pompei palace at Verona (fig. 13) is by San Micheli (1484-1549), the architect of the Grimani palace at Venice—a work which embraces all the elegance of classical art, with the most perfect appropriateness to the purposes of a modern palace. The Pompei palace, although by the same architect, is of a much more simple character. It has a basement of arched rustic work surmounted by engaged columns of the Doric order, with semicircular headed windows between.

From Italy the revived classic style soon spread to France. Francis I. invited Primaticcio, Benvenuto Cellini, Serlio, and others to that country, who were employed by him upon the palace of Fontainebleau and other works. The palace of the Louvre was begun by Pierre Lescot (1510-1578), and the first portion was completed by him in 1578. Various portions have been added thereto at different times by several architects, down to the time of the late empire. The portion given (fig. 11) represents the pavilion of Flora in connection with the Tuileries, and a part of the long gallery, but it has been somewhat modified and altered by Napoleon III. The palace of Versailles was the great work carried out during the long reign of Louis XIV. by the architects François Mansard (1598-1666) and his nephew Jules Hardouin Mansard (1647-1708). They also erected the church of the Invalides, and the former was engaged on the Louvre. The eastern façade of the Louvre was the work of Perrault (1613-1688).

The introduction of the Renaissance style into England was somewhat slower and more uncertain than into other parts of Europe. Among the earliest known examples in England of the pure Italian Renaissance are the monuments of Henry VII. and his mother, the Countess of Richmond, in Westminster Abbey. These were executed during the reign of Henry VIII. by Torrigiano (1472-1522), a Florentine, and a fellow pupil with Michael Angelo. It is said that he fled to England in consequence of his having quarrelled and broken with a stone the nose of Michael Angelo. The monument of Henry VII. was finished about the year 1519, and was looked upon with great admiration by English artists of that period.

Among many other foreign artists employed by Henry VIII. was the renowned Hans Holbein (1498-1543), who came to this country in 1526. He erected for the king the celebrated gates at Whitehall,<sup>5</sup> and he is supposed to have designed the oak stall work in King's College Chapel, Cambridge. From these early artists of the Renaissance school English architects imbibed classic forms, and combining these with their own native style produced those beautifully picturesque old buildings which we call Elizabethan,<sup>6</sup> and of which so many are still in existence. The most conspicuous name of this period in England was that of John Thorpe, who flourished from 1558 to 1608. He was architect of most of the principal and palatial edifices erected during the reigns of Elizabeth and James I. The earliest work on architecture published in England was by John Shute in 1563. We now approach the time of Inigo Jones (1572-1652), the first English architect that worked in the pure Italian Renaissance, although his early work was in the debased style of the period. He visited Italy before 1605, and at Venice became acquainted with the works of Palladio, of whom he became an ardent admirer. His great work was the designs for the palace at Whitehall, of which only a small portion was ever erected, namely, the Banqueting House (fig. 12), now used as a royal chapel. This was begun in 1619 and finished in two years. Had the entire palace been erected as designed, it would have been by far the most magnificent as well as the largest in Europe. It was, however, conceived far beyond the means, as it was far beyond the wants, of the monarch

<sup>3</sup> The Pitti palace is said to have been designed by Brunelleschi, the Strozzi by Cronaca (1454-1509).

for whom it was designed; and the political troubles of the time put a stop to the work, and prevented any other portion of it from being executed. Among the numerous works by this architect, are the church of St. Paul, Covent Garden, Shaftesbury House, Aldersgate Street, York Stairs, and a villa at Chiswick for the Duke of Devonshire. The design for this last was suggested by a villa at Vicenza by Palladio.

During the time of the Commonwealth the history of architecture is a blank, but on the restoration of the monarchy the art began to revive. The fire which destroyed London in 1666, a few years after the death of Inigo Jones, brought into notice England's great architect, Sir Christopher Wren (1632-1723), whose career began under Charles II. He was at Paris studying the works then going on there when the great fire occurred, and he hurried back to aid in the work of restoration. His first step was that of preparing a plan on which he proposed the city should be rebuilt, and had it been followed it would have made London not only one of the handsomest, but one of the most convenient cities in the world. The opportunity, however, was lost, and we cannot but regret the shortsightedness of our forefathers.

Although he was not able to induce the authorities of the time to adopt his plan for the rebuilding of the city, the fire gave him the opportunity of erecting St. Paul's Cathedral and about fifty other churches; and he so completely established his reputation that nearly every work of importance for well-nigh half a century was intrusted to his care. The greatest of all his works is, of course, St. Paul's, which, after St. Peter's at Rome, is the most splendid church erected in Europe in the revived style of classical architecture. The foundation-stone was laid in 1675, and thirty-five years afterwards the top stone of the lantern was laid by Sir Christopher Wren, thus practically completing the building in 1710.

A building on which the fame of Wren is as justly founded as upon St. Paul's itself, is St. Stephen's Church, Walbrook, the interior of which is represented in fig. 5. It is divided longitudinally into five aisles by four rows of Corinthian columns (see plan, fig. 4). The four columns in the centre being omitted it forms an octagon on which arches are turned, and above which, by means of pendentives, a dome is formed with a lantern thereon, the whole producing, in a very small compass, the most pleasing interior of any Renaissance church which has yet been erected in England. Among the other works of Wren none are more eminently entitled to praise than the towers and steeples of his churches, and that of Bow Church (fig. 10) is beyond all doubt the most elegant of its class erected since the Reformation. There is in its composition a variety of outline and an elegance of detail

which it is impossible to find in any other work of the kind. It is produced by a masterly invection of the form of a Gothic spire, with a clothing of Italian architecture.

Sir Christopher Wren had but one pupil who deserves any notice, Nicholas Hawksmoor (1666-1736), who erected the churches of St. Mary Woolnoth, Lombard Street; and St. George's, Bloomsbury, London. After his death James Gibbs (1683-1754), the architect of St. Martin's-in-the-Fields, and the Radcliffe Library, Oxford, succeeded to much of the public patronage. Other well-known architects of the time were Sir John Vanburgh (1666-1726), the architect of Blenheim House; W. Kent (1684-1748), architect of the Horse-Guards; Henry Flitcroft, who in 1733 erected St. Giles-in-the-Fields, the last of the churches after the manner of Sir Christopher Wren; Robert and James Adam (1728-1794), who erected the Adelphi and Portland Place; and Sir William Chambers (1726-1796), the architect of Somerset House, and author of an excellent treatise on civil architecture, which is still a standard text-book. With Sir William Chambers it may be said that the pure English Renaissance was brought to a close.

The evil influence of the debased, or Rococo, style of architecture prevalent in France during the latter part of the reign of Louis XIV. and the reign of Louis XV., acted unfavourably upon the art in England. This was, however, in a great measure counteracted by the publication of Stuart and Revett's *Antiquities of Athens*, commenced in 1762, and continued by the Dilettanti Society. This splendid work, which was not completed for many years, caused such a strong feeling for Greek art that it became a mania. During the early part of this century no building was complete without a Doric portico, and between the years 1819 and 1822 Inwood built the new St. Pancras Church after the manner of a Greek temple in the Ionic style. But no English church is complete without a steeple, and the architect was obliged to add a lofty tower. This he did, violating all Greek propriety, by piling it up on the top of his temple.

With the reign of our present queen the Gothic revival set in, and the determination of parliament to erect the new parliament buildings in mediæval character gave a great impulse to the growing taste. At the present time the rage for Gothic has somewhat subsided, and a new style is in vogue, designated the "Queen Anne style." Why so called appears extremely doubtful, as nothing of a similar character appeared in that queen's reign.

## REPTILES.

### ILLUSTRATIONS OF TERMS RELATING TO REPTILES AND AMPHIBIA.

IN popular language the classes of animals designated by naturalists Reptilia and Amphibia are both included under the common designation of Reptiles. They have many characters in common; and there seems to a general observer by no means the same necessity for arranging them in two classes, as for separating into three distinct classes the Mammalia, Birds, and Fishes. Older naturalists, indeed, among whom were Linneus and Cuvier, considered the Amphibia as only an order of the Reptilia. Modern naturalists, however, guided by anatomical details, are agreed in placing the Amphibia, that is, the frogs, toads, and newts, &c., in a separate class from the reptiles. By Huxley the former have been arranged along with the fishes to form the group Ichthyopsida, one of the three primary sections into which he divides all the vertebrata; while he puts the reptiles in the class Sauropsida along with the birds. Reptiles in general, however, are

altogether different in most characters from birds, being cold-blooded and covered with plates or scales instead of feathers, though they agree with birds in being produced from eggs.

The most obvious distinction between Reptiles and Amphibians, and one which is sufficient for general purposes, is, that the skin of the Reptilia is covered with scales or bony plates, while the Amphibia have the skin naked. The Reptiles also breathe universally by lungs; while the Amphibia breathe during the early part of their life, or even the whole of it, by gills or branchiæ.

### REPTILES.

The body of reptiles is generally of an elongated form, the tortoises and their allies presenting the most notable exception to this rule. The limbs may be wanting, as in serpents;

or only a pair may be developed, as in certain lizards; while in most reptiles all four limbs are present. The external covering varies greatly, and a distinction between the groups of reptiles has been based on the varying character this exhibits. Accordingly those that possess scales alone are designated Squamata or Squamate Reptiles (*L. squama*, a scale); those in which bony plates are developed in addition to scales (as crocodiles) are called Loricata or Loricated Reptiles (*L. lorica*, a coat of mail).

In the skeleton of reptiles the five regions into which the spine is ordinarily divided may be recognized:—the cervical, dorsal, lumbar, sacral, and caudal. The cervical vertebrae usually possess small ribs, and are generally seven in number. The dorsal vertebrae, which carry the ordinary ribs, vary in number. The sacral vertebrae, two in number, are united to form the single *sacrum*. The vertebrae of the tail are numerous. In the python there are as many as 422 vertebrae in all. The bones of the shoulder-girdle on either side include a *scapula* or shoulder-blade, and a *coracoid* bone, the latter articulating with the *sternum* or breast-bone. The fore limbs consist each of a *humerus* or bone of the upper arm, of a *radius* and *ulna* (fore-arm), of three carpal or wrist bones, and of five digits. The hinder limbs are of similar structure. The skull of reptiles has but one occipital condyle (as in birds) by means of which it articulates with the spine.

The teeth are generally well developed in reptiles, but in the tortoises and turtles there are no teeth, the jaws, like those of birds, being simply ensheathed in horn. The reptilian teeth, like those of the lower vertebrata generally, are adapted less for mastication than for merely retaining the food while it is being swallowed. Save in crocodiles and some extinct forms the teeth are not implanted in sockets, but are attached in various ways and by bony union to the jaw-bones. As seen in the poison-fangs of serpents several of the teeth may be modified for special purposes. The teeth vary greatly in number. The tongue may be elongated, distensible, and bifid, as in many lizards and serpents; or short, thick, and non-protrusible, as in other lizards; or it may be completely attached and fixed, as in crocodiles. The stomach is mostly pear-shaped, and in serpents it is capable of great distension. In the crocodiles it resembles the gizzard of a grain-eating bird in its high muscularity. The intestine is generally short, and exhibits a division into the small and the large portions. The rectum terminates in a *cloaca* which (as in birds) forms the common chamber in which terminate the efferent ducts of the urinary and generative organs. Reptiles eat and drink comparatively little, and can go without food for a long time.

The heart in reptiles consists of two auricles (right and left) and one ventricle, except in crocodiles, which animals possess two auricles and two ventricles. The chief peculiarity in the circulation consists in the mixture of venous with arterial blood, which takes place in the common ventricle of the heart in ordinary reptiles, and in the neighbourhood of that organ in crocodiles. In the ventricle the venous blood from the system and the pure or arterial blood from the lungs are mixed together, and the ventricle by its contractions drives this mixture at once to the lungs and through the system. The general system in the reptiles, very different from what is the case in birds and mammals, is nourished by impure or mixed blood. This circulation also exists in the amphibia, which, together with the reptiles proper, present a slow respiration and sluggish habits. Respiration is carried on solely by means of lungs, the presence of branchiae or gills always in early life, and sometimes in the adult life also of amphibians, constituting a marked difference between the latter and reptiles. In serpents and some lizards only one lung is fully developed, the right lung being usually abortive.

Reptiles possess the various senses in tolerable perfection. The nasal cavities are of large size and open posteriorly into the mouth. In the crocodiles the hinder apertures open very far back in the mouth, this arrangement enabling these animals to hold their prey under water so as to drown it,

whilst their own respiration is carried on unimpeded through the nostrils. The eyes of reptiles are usually of small size, and as regards their protective coverings vary throughout the class. In serpents there is a transparent membrane in front of the eye, supplying the place of eyelids, and hence the stony gaze of these animals, no process of winking taking place. This membrane is shed periodically along with the skin. In the lizards movable and ordinary eyelids exist, while in the tortoises there is a nictitating membrane. The ear is more or less perfectly developed. The crocodiles possess a movable valve by which they can close at will the tympanum of each ear; in these, too, most of the structures found in the higher vertebrata are represented.

The young of all reptiles are produced from ova or eggs. The ova are in general retained within the body of the parent until the development of the young has proceeded to some extent. In some serpents and lizards the young actually escape from the eggs while the latter are still contained within the parent oviduct. This mode of reproduction is what is known as *ovo-viviparous*. The eggs are in general of comparatively large size, and provided with a thick parchment-like shell and a large yolk. In many instances the eggs are deposited in sand and hatched by the sun's heat.

Reptiles are adapted by nature for very various modes of life. They may be fitted for living either on land or in the water, and some of them (such as the dragons) can even sustain themselves during short flights in the air. The extinct pterodactyls seem to have been endowed with excellent powers of flight, having large wings somewhat similar to those of the bats. Some of them live constantly in the water, as the turtles; while the crocodile and alligator, though most at home in the water, frequently betake themselves to the dry land. They reach their greatest development both as regards size and as regards numbers in the tropical regions. Some of them furnish food for man, though as a whole they are of little direct benefit to mankind.

Living reptiles are divided into four orders, viz. the Lizards, the Crocodiles, the Tortoises, and the Serpents, as below. In former periods of the earth's history many reptiles of gigantic size and strange form inhabited our globe, very different from those that now exist. These extinct forms have been classed, on the evidence of fossil remains, into several orders additional to those here given.

## AMPHIBIA.

It has been mentioned above that the Amphibia differ from the reptiles in always possessing gills in early life and in having the skin naked. To these points of difference we must add that in the Amphibia the skull is joined to the spine by two condyles, while the reptiles have only one. Another and most characteristic feature of the Amphibia is that they undergo a *metamorphosis* in the course of their development—the phases of such metamorphosis being familiarly exemplified in the series of changes through which the tadpole of the frog becomes developed into the perfect animal.

Order I.—ANOURA (*Tailless*). Frogs and Toads.

Characteristics: Destitute of tail; body broad and short; skin naked and moist; limbs four; head flat and broad; gape wide. Undergo a metamorphosis, the young animal or tadpole having a tail, which is afterwards absorbed.

# DESCRIPTION OF THE PLATES.

## SIGNALS.

### THE INTERNATIONAL SYSTEM OF SIGNALLING AT SEA.

SIGNALLING, that is, the use of arbitrary signs or signals for conveying information or messages to persons who are beyond the reach of the human voice, may be effected in very many ways. That most generally in use is now the electric telegraph, but this has been so developed and perfected, especially by the invention of the telephone, that at the present day telegraphy is hardly regarded as merely a system of signalling. The original telegraph, however, had nothing to do with electricity, being a kind of semaphore or similar apparatus, such as, in a very simple form, is used on railways, and, with much wider scope, for maritime or other purposes. The immense increase in the world's shipping and the commercial intercourse of nations has rendered it a matter of the highest importance that ships should have a simple means of communicating with each other at sea, and also if necessary with persons on shore. Various systems have been proposed and more or less adopted, a well-known one being that of Captain Marryat; but the International Code of Signals issued by the British Board of Trade is now the one that may be said to prevail all over the world. The International Code was prepared and first published in 1857, in accordance with the views and recommendations of a committee of eminent naval authorities appointed in 1855. In the Code 18 flags are employed (coloured as shown in the plate), namely, 1 burgee, 4 pennants, and 13 square flags, besides a "code-signal" or "answering pennant". The 18 flags represent the consonants of the alphabet, and it is by a combination of two, three, or four of these flags—the flags being hoisted one above the other—that arbitrary signs are made, representing a multitude of words and sentences, the meaning of any particular combination being laid down in the code-book. The code-book for those that speak English is of course in English, but other nations have it in their own language, and as the same combination of flags has always the same signification the interpretation of the signals is easy. Certain simple devices have been adopted in order to render the understanding of the signals still easier; but of course any one having to do with the Code must first be familiar with its alphabet. Thus, First, signals of *two flags*: with the burgee uppermost these are attention signals; with the pennant uppermost they are compass signals; with a square flag uppermost they are urgent, danger, or distress signals. Second, signals of *three flags*: these relate to general subjects of inquiry or communication, including latitude, longitude, and time signals. Third, signals of *four flags*: those with the burgee uppermost are geographical signals; those with the pennants C, D, or F uppermost are spelling and vocabulary signals; those with the pennant G uppermost are names of men-of-war; those with a square flag uppermost are names of merchant vessels. Single flags are only used in the case of the affirmative, negative, and answering pennants, and the flags hoisted at one time are never more than four, yet the permutations of these eighteen flags are capable of giving a total of 78,642 different signals. The flags were adopted from Capt. Marryat's Code, as far as applicable, with some slight variations.

The examples given in the plate will show plainly how the Code works. We begin with the two-flag signals. As just explained those with the burgee uppermost call for attention. Of these BK is the special signal for attention, being equivalent

to "pay attention". The flag CH having the pennant uppermost is a compass signal, denoting, as explained in plate, N. N. E. Similarly the next three two-flag signals, having the square flag uppermost, are all signals of urgency, danger, or distress. A person who sees any of these flags hoisted and wishes to know what it means has simply to turn to the proper section of the code-book, where the combinations CH, NS, &c. may be found in their proper alphabetic order. Signals made with three flags, as explained, are all of a general character, and include numbers, weights and measures, and a variety of matters. The four-flag signals, as we have seen, are divided into classes, those with the burgee uppermost being geographical. Accordingly the combinations BJSW and BFGN represent respectively Egypt and Liverpool, as the code-book will show. The combinations CFHJ and CDST, being four-flag combinations with the pennant C uppermost, are spelling signals, and the code-book will enable us to discover that the first stands for RAD and the second for NOR, together making up the name Radnor. The combination HRGW is one with a square flag uppermost; accordingly, as explained above, it is the name of a merchant-vessel, the vessel in this case being the *Aurania* of Liverpool. All registered British vessels, as well as a number of foreign ones, have certain signal letters allotted to them by means of which they may be easily reported when spoken at sea or passing signal stations. These are all contained in a list published as an appendix to the British International Code.

Having given some hints as to the interpreting of a signal we must now say a few words on the making of signals. Before a signal is made the ensign with the code pennant under it is to be hoisted at the peak, that is, the upper outer end of the gaff of the spanker or a corresponding sail. The flags with which the signals are made are hoisted at the mast-head. Persons who are in the habit of signalling and reading signals will no doubt remember the flags to be used for a certain number of the commoner ones, otherwise the signal book will have to be consulted. Suppose the inquiry "What is the news from Egypt?" is to be signalled. By turning up the entry NEWS at its proper alphabetical position in the book a number of phrases and sentences will be found in which this word occurs, among them being "What is the news from —?" with the signal letters BWD appended to it. The three corresponding flags are accordingly hoisted at the mast-head. Similarly "Egypt" will be found in its proper place in the alphabetical list of geographical names in the signal-book, with the letters BJSW opposite the entry, the corresponding flags being those shown on the plate. In a similar manner the four sets of four flags required to signal the sentence "*Aurania*—sailed from—Liverpool—yesterday morning" will easily be found.

The set of signals shown on the plate as *distance signals* are used when on account of distance or the state of the atmosphere it is impossible to distinguish signals made in the ordinary way with the code flags. The characteristic of the distance signal is the *ball*, one ball at least appearing in every hoist of the distance code. The other symbols may be one or two pennants or one or two square flags of any colour. By the various combinations of these all the eighteen consonants of the code alphabet are made. The plate does not show the

whole of these, but it gives quite a sufficient number to enable the system to be understood. Most of the individual letters have a special signification of their own, the letter L, for instance, also being the signal asking for a pilot, the letter M asking for a tug, and so on. The letter H signifies "You may communicate by the semaphore if you please". There are many semaphores established on the French, Italian, and Portuguese coasts, connected by telegraph with each other and with various other places. Passing vessels can exchange communications with these semaphores, and if desired their messages are forwarded to their destinations, according to an established tariff of rates. The semaphore signals are made

on the same system as the distance signals, the position or direction of the arms indicating respectively the pennant, the ball, or the flag: the arm pointing downwards stands for a pennant, in a horizontal position for a ball, and pointing upwards for a flag. The use of the semaphore is common in the navy, in the merchant service it is much less so.

As the above signals are of course visible only by day other methods of signalling require to be adopted at night, but as yet there is no one method in general use. Flashing lights of the steam whistle are more or less employed, and by both of these the dot and dash of the Morse-alphabet may be imitated. (See MORSE-ALPHABET in Dict.)

## FOUR-MASTED SHIP.

THE vessel illustrated is of a type recently introduced, and exhibits the great advance recently made in the construction of merchant sailing ships. To the eye there is no very great difference between a large three-master and a four-master, but the latter possesses several advantages over the former which render the increasing use of these vessels highly probable. In a four-masted vessel the masts, yards, and sails do not require to be so large as in a three-master in order to receive an equal wind-pressure, the rigging has less height and greater spread transversely, and consequently there is less difficulty in working the ship, and less danger of dismasting. The wind-pressure is also more equally distributed fore and aft, and the centre of effort of the sails being lower down, the vessel heels over less and thus gains in speed, while also answering better to her helm. Another advantage is that such vessels can be more easily managed in tacking and wearing at sea owing to the jigger-mast and fore-mast

being nearer the ends of the ship, and thus giving a more powerful leverage when required. In our plate the fourth or jigger mast is barque-rigged, but it is often square-rigged like the others. A further advantage is that the dimensions of the three foremost masts and their yards can be so arranged that all the principal sails are interchangeable, so that only a limited number of spare sails is required. The vessel shown in the plate carries upper and lower topsails and topgallant sails: this is an improvement that had been previously introduced in three-masted vessels. The adoption of the four-masted rig has enabled larger sailing vessels to be introduced than was found practicable with three masts, 2300 tons being about the extreme tonnage of three-masters, while four-masters range from 2000 to 3800 tons. From their greater handiness, too, these vessels can be managed by a relatively smaller number of hands, and thus are less expensive to keep afloat.

INTERNATIONAL CODE OF SIGNALS FOR SHIPS COMMUNICATING WITH EACH OTHER AT SEA, OR WITH STATIONS ON SHORE.

*"Hoisted under the ensign this flag becomes the "CODE SIGNAL" Signifying that a message is to be sent; the receiving Ship hoists it conspicuously as the "ANSWERING PENNANT." C and D, also the signals for YES and NO (as shown); P, serves as a pilot flag in many cases; also as the signal for the departure of the vessel (Blue Peter); Q, also the signal for quarantine.*

EXAMPLES OF COMBINATION OF TWO, THREE AND FOUR FLAGS TO FORM MESSAGES.

## EXAMPLES OF THE INTERNATIONAL SYSTEM OF DISTANCE-SIGNALS (COMBINING BALLS & FLAGS)

USED WHEN THE "CODE" CANNOT BE READ.

1, The letter B; also asks name of vessel or signal-station. 2, the letter C; also means "YES". 3, the letter D; also means "No". 4, the letter F; also "REPEAT SIGNAL OR HOIST IN A MORE CONSPICUOUS PLACE". 5, the letter G; also, "CANNOT DISTINGUISH YOUR FLAGS; MAKE DISTANCE-SIGNALS". 6, letter J. 7, letter K; also asks for despatches. 8, letter L; also asks for Pilot. 9, letter Q. 10, letter R; also "REPORT ME BY TELEGRAPH". 11, "Stop" after each complete signal. 12, Special Signal; "YOU ARE RUNNING INTO DANGER". 13, Special Signal; "SHORT OF PROVISIONS, STARVING". 14, Special Signal; "AGROUND, WANT IMMEDIATE ASSISTANCE".

## PILOT-FLAGS OF THE PRINCIPAL MARITIME NATIONS.

The above are the special pilot-flags belonging to the chief maritime nations of the world, these flags being hoisted by vessels requiring a pilot, according to the Merchant Shipping Act, 1873. The following signals used together or separately are to be deemed signals for a pilot in the day time, viz. (1) to be hoisted at the fore, the Jack or other national colour usually worn by merchant ships, having round it a white border one fifth of the breadth of the flag (as shewn above); or (2) the International Code pilotage signal indicated by PT. Some countries have no special pilot-flag but use only the International Code signal (PT) or P alone.

Pilot-Flags are also carried by pilot-boats and the British pilot-boats have a distinctive flag, half white, half red, divided horizontally, the red below the white.
